

NorDig Unified Test plan, ver 2.6.0

# **NorDig Unified Test Plan**

for

## **Integrated Receiver Decoders**

**for use in cable, satellite, terrestrial and IP-based networks**

<b>Part I – Introduction.....</b>	<b>9</b>
<b>1 Document History.....</b>	<b>10</b>
<b>2 References .....</b>	<b>11</b>
<b>3 Background.....</b>	<b>11</b>
<b>4 NorDig compliance testing .....</b>	<b>12</b>
<b>5 Test specifications for NorDig compliance.....</b>	<b>12</b>
<b>6 Testing and test report for NorDig compliance .....</b>	<b>12</b>
<b>6.1 Test item.....</b>	<b>13</b>
<b>6.2 List of Abbreviations .....</b>	<b>13</b>
<b>Part II - Test Cases .....</b>	<b>17</b>
<b>1 Introduction - Test Cases.....</b>	<b>18</b>
<b>2 Test Plan for NorDig - Test Cases.....</b>	<b>26</b>
<b>2.1 Task 1: Satellite tuner and demodulator.....</b>	<b>26</b>
2.1.1 QEF Quality Measurement Methods.....	26
2.1.2 Test cases .....	28
Task 1:1 General .....	28
Task 1:2 General .....	29
Task 1:3 Quality reception detector .....	29
Task 1:4 Symbol and FEC-rate (DVB-S2).....	29
Task 1:5 Input Frequency Range/Tuning range .....	31
Task 1:6 Tuning/ Scanning Procedures (with NIT) .....	32
Task 1:7 Tuning/ Scanning Procedures (without NIT) .....	32
Task 1:8 Control signals.....	33
Task 1:9 Demodulation (DVB-S2) .....	34
Task 1:10 RF Input Connector and Output Connector (option).....	36
Task 1:11 Input Signal Level .....	36
Task 1:12 Power Supply and Control Signal (to RF unit).....	38
Task 1:13 Power Supply and Control Signal (to single-channel RF unit) .....	39
Task 1:14 Performance: Digital interference .....	40
<b>2.2 Task 2: Cable Tuner and Demodulator .....</b>	<b>43</b>
2.2.1 QEF Quality Measurement Methods.....	43
2.2.2 Test cases .....	44
Task 2:1 General .....	44
Task 2:2 General .....	44
Task 2:3 Quality reception detector .....	45
Task 2:4 RF Characteristics: Input frequency range and input level, Digital channels.....	45
Task 2:5 RF Characteristics: Symbol rate and modulation .....	46
Task 2:6 RF Characteristics: Input impedance.....	47
Task 2:7 RF bypass .....	48
Task 2:8 Tuning/Scanning procedure (Automatic scan based on NIT) .....	48
Task 2:9 Tuning/Scanning procedure (Manual scan).....	49
Task 2:10 Tuning/Scanning procedure (Original_network_id, transport_stream_id and service_id triplet support) .....	50
Task 2:11 Tuning/Scanning procedure – Network default values.....	51
Task 2:12 Tuning/Scanning procedure – Factory default values .....	52
Task 2:13 Total input power .....	52
Task 2:14 RF Performance - C/N for Reference BER .....	53
Task 2:15 RF Performance - C/N with echo .....	54
Task 2:16 Performance Data: Noise figure .....	56
Task 2:17 RF Performance - Image Channel .....	58
Task 2:18 RF Performance – Digital Adjacent Channel .....	59
Task 2:19 RF Performance – Analog Adjacent Channel .....	60
Task 2:20 LO leakage .....	62
Task 2:21 Spurious emission.....	62
Task 2:22 Radiation .....	63
<b>2.3 Task 3: Terrestrial Tuner and Demodulator .....</b>	<b>64</b>
2.3.1 Test equipment summary .....	64
2.3.2 QEF Quality Measurement Methods.....	64
2.3.3 Bitrates .....	77
2.3.4 Receiver operability in SFN.....	78

2.3.5 0dB echo .....	79
2.3.6 Conditions for analogue TV .....	79
2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks .....	80
2.3.8 Stream packet structure in Receiver Buffer Model (RBM) tests for DVB-T2 .....	86
2.3.9 Test cases .....	87
2.3.9.1 Test cases – DVB-T IRD .....	87
Task 3:1 General .....	87
Task 3:2 General .....	87
Task 3:3 Quality reception detector .....	88
Task 3:4 Frequencies: Center frequencies .....	88
Task 3:5 Frequencies: Frequency offset .....	92
Task 3:6 Frequencies: Signal bandwidths .....	93
Task 3:7 Modes .....	95
Task 3:8 Tuning/Scanning Procedure: General .....	96
Task 3:9 Tuning/Scanning Procedures: Basic status check .....	97
Task 3:10 Tuning/Scanning Procedures: Automatic channel search for the same service bouquet .....	98
Task 3:11 Tuning/Scanning: Automatic channel search for different service bouquets .....	103
Task 3:12 Tuning/Scanning Procedures: Manual Channel Search .....	105
Task 3:13 Verification of Signal Strength Indicator (SSI) .....	107
Task 3:14 Verification of Signal Quality Indicator (SQI) .....	110
Task 3:15 Changes In Modulation Parameters .....	113
Task 3:16 RF input connector .....	115
Task 3:17 RF output connector .....	115
Task 3:18 Performance: BER vs C/N verification .....	116
Task 3:19 Performance: C/N performance on Gaussian channel .....	118
Task 3:20 Performance: C/N performance on 0dB echo channel .....	121
Task 3:21 Performance: Minimum receiver signal input levels on Gaussian channel .....	122
Task 3:22 Performance: Minimum IRD Signal Input Levels on 0dB echo channel .....	124
Task 3:23 Performance: Noise figure on Gaussian channel .....	127
Task 3:24 Performance: Maximum Receiver Signal Input Levels .....	128
Task 3:25 Performance: Immunity to “digital” signals in Other Channels .....	130
Task 3:26 Performance: Immunity to “LTE 700 MHz” signals in Other Channels .....	132
Task 3:27 Performance: Immunity to “LTE 800 MHz” signals in Other Channels .....	134
Task 3:28 Performance: Performance in Time-Varying Channels .....	136
Task 3:29 Performance: Synchronisation for varying echo power levels in SFN .....	138
Task 3:30 Performance: C/(N+I) Performance in SFN for more than one echo .....	140
Task 3:31 Performance: C/(N+I) Performance in SFN inside the guard interval .....	143
Task 3:32 Performance: C/(N+I) Performance in SFN outside the guard interval .....	149
2.3.9.2 Test cases – DVB-T2 .....	151
Task 3:33 DVB-T2: Frequencies: Center frequencies .....	151
Task 3:34 DVB-T2: Frequencies: Frequency offset .....	155
Task 3:35 DVB-T2: Frequencies: Signal bandwidths .....	156
Task 3:36 DVB-T2: Modes .....	158
Task 3:37 DVB-T2: MISO .....	162
Task 3:38 DVB-T2: Input Mode B (multiple PLPs) .....	164
Task 3:39 DVB-T2: Input Mode B (multiple PLPs and common PLP) .....	165
Task 3:40 DVB-T2: Input Mode B (RBM for TDI) .....	166
Task 3:41 DVB-T2: Input Mode B (RBM for DJB) .....	167
Task 3:42 DVB-T2: Input Mode B (RBM when FEF present) .....	169
Task 3:43 DVB-T2: Normal mode (NM) .....	171
Task 3:44 DVB-T2: Input Mode A (zero power FEF present) .....	172
Task 3:45 DVB-T2: Input Mode A (RBM when FEF present) .....	173
Task 3:46 DVB-T2: Auxiliary streams .....	175
Task 3:47 DVB-T2: Reception of version 1.1.1 .....	176
Task 3:48 DVB-T2: Tuning/Scanning Procedures: Automatic channel search for the same service bouquet .....	177
Task 3:49 DVB-T2: Tuning/Scanning Procedures: Basic status check .....	182
Task 3:50 DVB-T2: Verification of Signal Strength Indicator (SSI) .....	183

Task 3:51 DVB-T2: Verification of Signal Quality Indicator (SQL).....	186
Task 3:52 DVB-T2: Changes In Modulation Parameters .....	189
Task 3:53 DVB-T2: Time interleaving .....	191
Task 3:54 DVB-T2: Input/Output Data Formats.....	192
Task 3:55 DVB-T2: Performance: BER vs C/N verification .....	193
Task 3:56 DVB-T2: Performance: C/N performance on Gaussian channel.....	194
Task 3:57 DVB-T2: Performance: C/N performance on 0dB echo channel .....	197
Task 3:58 DVB-T2: Performance: Minimum receiver signal input levels on Gaussian channel.....	198
Task 3:59 DVB-T2: Performance: Minimum IRD Signal Input Levels on 0dB echo channel.....	201
Task 3:60 DVB-T2: Performance: Receiver noise figure on Gaussian channel .....	203
Task 3:61 DVB-T2: Performance: Maximum Receiver Signal Input Levels .....	204
Task 3:62 DVB-T2: Performance: Immunity to “digital” signals in Other Channels.....	206
Task 3:63 DVB-T2: Performance: Immunity to “LTE 700 MHz” signals in Other Channels.....	209
Task 3:64 DVB-T2: Performance: Immunity to “LTE 800 MHz” signals in Other Channels.....	212
Task 3:65 DVB-T2: Performance: Performance in Time-Varying Channels .....	213
Task 3:66 DVB-T2: Performance: Synchronisation for varying echo power levels in SFN.....	216
Task 3:67 DVB-T2: Performance: C/(N+I) Performance in SFN for more than one echo .....	218
Task 3:68 DVB-T2: Performance: C/(N+I) Performance in SFN inside the guard interval .....	222
Task 3:69 DVB-T2: Performance: C/(N+I) Performance in SFN outside the guard interval .....	228
<b>2.4 Task 4: IP-Based Front-end .....</b>	<b>230</b>
<b>2.5 Task 5: MPEG2 demultiplexer .....</b>	<b>231</b>
Task 5:1 SI utilization .....	231
Task 5:2 CA descriptor interpretation .....	231
Task 5:3 Maximum transport stream data rate .....	231
Task 5:4 Number of elementary streams.....	232
Task 5:5 Section filtering .....	233
Task 5:6 Variable Bitrate Elementary Streams .....	233
Task 5:7 Mixture of SD and HD services .....	234
Task 5:8 Descrambler Performance .....	235
Task 5:9 System clock recovery.....	236
<b>2.6 Task 6: Video .....</b>	<b>237</b>
Task 6:1 Video Decoder - General.....	237
Task 6:2 Video Decoder – Resolutions and Frame rates.....	238
Task 6:3 Up-sampling/Up-conversion .....	239
Task 6:4 Video Decoder - Colorimetry.....	240
Task 6:5 Video Decoder - Dynamic changes in video stream .....	241
Task 6:6 Video Decoder - AVC still picture .....	242
Task 6:7 Minimum video bandwidth .....	243
Task 6:8 Frame cropping .....	244
Task 6:9 Overscan.....	245
Task 6:10 High Definition Video Output and Display.....	246
Task 6:11 Down-conversion of High Definition Video for Standard Definition output.....	246
Task 6:12 16:9 displayed on 4:3 monitors .....	247
Task 6:13 Displaying 4:3 Material on 16:9 Monitors .....	248
Task 6:14 Rescaling for HbbTV application.....	248
<b>2.7 Task 7: Audio .....</b>	<b>249</b>
Task 7:1 Audio User Preference Settings.....	249
Task 7:2 MPEG-1 Layer II: Requirements .....	249
Task 7:3 MPEG-1 Layer II: Analogue audio output .....	249
Task 7:4 MPEG-1 Layer II: HDMI output interface.....	250
Task 7:5 MPEG-1 Layer II: S/PDIF output interface .....	251
Task 7:6 AC-3: Requirements.....	252
Task 7:7 AC-3: Analogue audio output .....	254
Task 7:8 AC-3: HDMI output and HDMI ARC interface.....	255
Task 7:9 AC-3: S/PDIF output interface .....	256
Task 7:10 AC-3: Metadata .....	257
Task 7:11 E-AC-3: Requirements .....	257
Task 7:12 E-AC-3: Analogue audio output.....	258
Task 7:13 E-AC-3: HDMI output and HDMI ARC interface .....	259

Task 7:14 E-AC-3: S/PDIF output interface .....	261
Task 7:15 E-AC-3: Metadata .....	262
Task 7:16 HE AAC: Requirements .....	263
Task 7:17 HE AAC: Analogue audio output.....	264
Task 7:18 HE AAC: HDMI output and HDMI ARC interface .....	265
Task 7:19 HE AAC: S/PDIF output interface .....	266
Task 7:20 HE AAC: Metadata .....	268
Task 7:21 Audio prioritizing - Audio language support .....	269
Task 7:22 Audio Prioritising – audio format and stream type .....	270
Task 7:23 Audio Prioritising – audio type .....	272
Task 7:24 Audio Prioritising – audio format signaling missing.....	274
Task 7:25 Audio video synchronization.....	275
Task 7:26 Adjustment of Video/audio-delay.....	277
Task 7:27 Audio handling when changing service or audio format .....	278
Task 7:28 Dynamic changes in audio components .....	278
Task 7:29 Audio descriptors .....	280
Task 7:30 Clean audio.....	280
Task 7:31 Supplementary audio.....	281
Task 7:32 IRD Internal Reference Level .....	282
Task 7:33 Loudness levels - Audio Output Levels .....	283
<b>2.8 Task 8: Teletext and subtitling .....</b>	<b>286</b>
Task 8:1 Subtitling - user preferences.....	286
Task 8:2 Subtitling - Only display subtitling if match language in user preferences .....	286
Task 8:3 Subtitling - Temporary changes to subtitling settings .....	287
Task 8:4 Subtitling – Subtitling mode (Normal and Hard of hearing subtitling) .....	288
Task 8:5 Subtitling – DVB Subtitling and subtitling priority (DVB/EBU) .....	289
Task 8:6 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext.....	290
Task 8:7 Subtitling - coexistent with HbbTV applications .....	291
Task 8:8 Teletext – EBU Teletext level 1.5 .....	292
Task 8:9 Teletext - decoding method(VBI) .....	293
Task 8:10 Teletext decoding method(OSD).....	293
Task 8:11 Teletext – teletext pages .....	294
Task 8:12 Teletext – teletext pages - cache.....	295
Task 8:13 Subtitling – teletext subtitling .....	296
Task 8:14 Subtitling – DVB Subtitling .....	297
<b>2.9 Task 9: Interfaces and Signal Levels .....</b>	<b>300</b>
Task 9:1 Two-way Interface .....	300
Task 9:2 SCART Interface.....	300
Task 9:3 HDMI interface – HD Ready .....	301
Task 9:4 HDMI interface – EDID information .....	302
Task 9:5 HDMI interface – Original format .....	303
Task 9:6 HDMI – Manual setting for resolution .....	303
Task 9:7 HDMI – Signal protection.....	304
Task 9:8 Analogue video interface(Optional).....	306
Task 9:9 Remote Control Function Keys .....	306
Task 9:10 Remote Control Function Keys for PVR.....	307
Task 9:11 Remote Control Key event mapping for NorDig Hybrid .....	308
<b>2.10 Task 10: Interfaces for Conditional Access .....</b>	<b>309</b>
Task 10:1 Use of Common Interface .....	309
Task 10:2 Smart Card Interface .....	309
<b>2.11 Task 11: The System Software Update.....</b>	<b>311</b>
2.11.1 Test equipment summary .....	311
2.11.2 Test cases .....	313
Task 11:1 IRD System software update using DVB SSU simple profile.....	313
Task 11:2 IRD System software update using DVB SSU enhanced profile - scheduling.....	316
Task 11:3 IRD System software update using DVB SSU Notifications update type 0x4.....	319
Task 11:4 SSU end user functionality .....	321
Task 11:5 Common interface plus (CI+) CAM module system software update .....	322
<b>2.12 Task 12: Performance .....</b>	<b>324</b>

Task 12:1 Video performance .....	324
Task 12:2 Audio performance.....	324
Task 12:3 Zapping time .....	325
<b>2.13 Task 13: Service Information.....</b>	<b>327</b>
2.13.1 General.....	327
Task 13:1 SI: General.....	327
Task 13:2 SI: General – Undefined data structures.....	327
Task 13:3 SI: General – ‘Actual’ and ‘Other’ tables.....	327
Task 13:4 SI: SI data available through an API.....	328
Task 13:5 SI: Text strings and field size of the SI descriptor.....	328
2.13.2 Static PSI/SI data.....	329
Task 13:6 NIT_actual – frequency_list_descriptor .....	329
Task 13:7 NIT_actual – Missing terrestrial_system_delivery_descriptor.....	330
Task 13:8 NIT_actual – Missing T2_delivery_system_descriptor.....	332
Task 13:9 SDT_actual service_descriptor and CA_identifier_descriptor .....	333
2.13.3 Quasi static PSI/SI data.....	334
Task 13:10 Quasi static update of SDT_actual .....	334
Task 13:11 Quasi-static update of SDT_actual – linkage to NorDig simulcast replacement service.....	335
Task 13:12 Quasi-static update of NIT_actual – Linkage to an information service about the network	337
Task 13:13 Quasi-static update of NIT_actual – Linkage to EPG service .....	338
Task 13:14 Quasi-static update of NIT_actual – Linkage to TS that carries EIT sch information for all services.....	339
Task 13:15 Quasi-static update of NIT_actual – Linkage to System Software Download service .....	339
2.13.4 Dynamic PSI/SI data.....	340
Task 13:16 Dynamic update of SDT_actual running status and linkage to a service replacement service .....	340
Task 13:17 Dynamic update of EIT actual/other p/f.....	341
Task 13:18 Dynamic update of EIT_actual p/f CA_identifier_descriptor .....	342
Task 13:19 Dynamic update of EIT actual/other p/f short_event_descriptor, extended_event_descriptor and content_descriptor .....	343
Task 13:20 Dynamic update of EIT actual/other p/f content descriptor and component_descriptor .....	345
Task 13:21 Dynamic update of EIT actual/other p/f parental_rating_descriptor .....	347
Task 13:22 Dynamic update of EIT actual/other p/f and schedule in ESG using linkage.....	348
Task 13:23 Dynamic update of EIT actual/other p/f and schedule in ESG.....	350
Task 13:24 PMT Descriptors - General .....	352
Task 13:25 PMT Descriptors – teletext pages, teletext subtitling and DVB subtitling.....	353
Task 13:26 Dynamic update of PMT PID values.....	354
Task 13:27 Dynamic update of PMT-Component priority (stream type) .....	355
Task 13:28 Dynamic update of PMT - Content_Protection_descriptor .....	357
Task 13:29 Dynamic update of TDT/TOT.....	358
<b>2.14 Task 14: Navigator.....</b>	<b>362</b>
Task 14:1 Navigator: General .....	362
2.14.1 Static PSI/SI data.....	363
Task 14:2 Service list - General requirement.....	363
Task 14:3 Service list – service types and categories.....	363
Task 14:4 Service list – use of NIT_other and SDT_other .....	365
Task 14:5 Service list - Inconsistent of SDT_actual and NIT_actual information.....	367
Task 14:6 Service list – NIT_actual interpretation.....	368
Task 14:7 Service list – NIT_actual original_network_ID .....	369
Task 14:8 Service list – NIT_actual network_ID.....	370
Task 14:9 Service list – Inconsistent SDT_actual/NIT_actual and SDT_other/NIT_other.....	371
Task 14:10 Service list – Handling of multiple channel lists from same networks and NorDig LCD....	372
Task 14:11 Service list – Simultaneous transmission of LCD v1 and v2 .....	375
Task 14:12 Service list – Simultaneous reception of multiple networks and NorDig LCD.....	377
Task 14:13 Service list - Priority of LCN between SD and HDTV services.....	378
2.14.2 Quasi static PSI/SI data.....	381
Task 14:14 Quasi-static update of service list – service addition.....	381
Task 14:15 Quasi-static update of service list – non-visible data service addition .....	382
Task 14:16 Quasi-static update of service list – services moved between different transport streams ...	383

Task 14:17 Quasi-static update of service list – service remove.....	385
Task 14:18 Quasi-static update of service list from NIT_actual for non-existing multiplexers.....	386
Task 14:19 Quasi-static update of service list from NIT_actual for removing a multiplex .....	388
Task 14:20 Quasi-static update of NorDig LCN v1 .....	389
Task 14:21 Quasi-static update of NorDig LCN v2.....	391
<b>2.15 Task 15: PVR Functionality.....</b>	<b>394</b>
Task 15:1 Recording File System .....	394
Task 15:2 Recording capacity .....	394
Task 15:3 Deletion of the recordings .....	395
Task 15:4 Failed and incomplete recordings.....	395
Task 15:5 File system intact after update.....	396
Task 15:6 Limitations in recorded content – no extraction .....	397
Task 15:7 Limitations in recorded content – downscaling of the HD content to the removable media..	397
Task 15:8 Disk Management.....	398
Task 15:9 General PVR recording – bitrates.....	398
Task 15:10 General PVR recording – service types.....	399
Task 15:11 ESG/EPG recording programming – individual events without CRID .....	400
Task 15:12 ESG/EPG recording programming – individual event with CRID.....	402
Task 15:13 ESG/EPG recording programming – individual event with CRID – same event recording.	402
Task 15:14 ESG/EPG recording programming – series.....	403
Task 15:15 Split recordings .....	404
Task 15:16 Split recordings- dynamic update of EIT .....	405
Task 15:17 Recommended events.....	406
Task 15:18 Alternative Recording .....	407
Task 15:19 Accurate Recording – EIT information present.....	408
Task 15:20 Accurate Recording – EIT information missing.....	409
Task 15:21 Accurate Recording – Loss of signal.....	410
Task 15:22 Accurate Recording – EIT update in stand-by .....	411
Task 15:23 Simultaneous recording – OTR and viewing.....	412
Task 15:24 Simultaneous recording – Scheduled recording and viewing.....	413
Task 15:25 Simultaneous recording – OTR and time-shift .....	413
Task 15:26 Simultaneous recording – Scheduled recording and time-shift .....	414
Task 15:27 Simultaneous recording and playback .....	415
Task 15:28 Back-to-back recordings – Static EIT information.....	415
Task 15:29 Back-to-back recordings – Changes in EIT information .....	417
Task 15:30 Timeshift recording .....	419
Task 15:31 Manual recording .....	419
Task 15:32 Manual recording – Changes in TDT/TOT .....	420
Task 15:33 One Touch Recording (OTR).....	421
Task 15:34 Automatic Conflict Handling – During programming .....	422
Task 15:35 Automatic Conflict Handling – After programming .....	423
Task 15:36 Maximum length of recordings .....	424
Task 15:37 Recording of parallel broadcast.....	425
Task 15:38 Playback - General .....	425
Task 15:39 Replay/Playback – trick modes in playback.....	426
Task 15:40 Replay/Playback – trick modes in timeshift.....	427
Task 15:41 Relative synchronisation .....	428
Task 15:42 Full service playback – Dynamic update of PMT audio language .....	428
Task 15:43 Full service playback – Dynamic update of PMT audio format.....	430
Task 15:44 Full service playback – Dynamic update of PMT audio type.....	431
Task 15:45 Full service playback – Dynamic update of PMT subtitling language.....	433
Task 15:46 Full service playback – Subtitling for the hard-of-hearing.....	435
Task 15:47 Full service playback – Dynamic update of PMT subtitling type .....	436
Task 15:48 Full service playback – Subtitling synchronization.....	437
Task 15:49 Full service playback – Subtitling synchronization in time-shift .....	438
Task 15:50 Full service playback – Dynamic update of PMT video and audio PIDs .....	439
Task 15:51 Full service playback – Dynamic update of video aspect ratio .....	441
Task 15:52 Full service playback – Dynamic update of PMT CA status.....	442
Task 15:53 Dynamic changes in video stream in playback.....	443

NorDig

Task 15:54 Parental lock during playback .....	444
Task 15:55 Maintaining scheduled recordings after network update .....	445
Task 15:56 User actions disturbing the recording .....	446
<b>2.16 Task 16: IRD System Software and API.....</b>	<b>448</b>
2.16.1 Introduction .....	448
2.16.2 List of test cases .....	449
2.16.3 Test cases .....	450
Task 16:1 – 16:50.....	450
Task 16:51 HbbTV Global setting .....	450
Task 16:52 – 16:59 (es.TDThibrida and fr.HDForum tests).....	451
Task 16:60 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext (8:6) .....	451
Task 16:61 Subtitling - coexistent with HbbTV applications (8:7).....	452
Task 16:62 Remote Control Key event mapping for NorDig Hybrid (9:11).....	452
<b>2.17 Task 17: User Preferences.....</b>	<b>454</b>
Task 17:1 Stored preferences .....	454
Task 17:2 Deletion of service lists .....	455
Task 17:3 Reset to factory mode.....	455
<b>AnnexA: NorDig Network Custodians .....</b>	<b>457</b>

## **Part I – Introduction**

## 1 Document History

Version	Date	Comments
Ver 1.0	11.2004	This is the first approved version of the complete NorDig Unified Test specification
Ver. 1.0.3	03.2007	This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 1.0.3
Ver 2.0	06.2008	This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 2.0. It also reflects that the NorDig logo is no more offered.
Ver. 2.2.1	01.2012	This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 2.2.1.
Ver. 2.2.2	11.2012	This is the updated version of the complete NorDig Unified Test specification. This release updated some DVB-S, DVB-T/T2 and PVR test cases. This release is compliant with the NorDig Unified specification ver. 2.2.1.
Ver 2.4	10.2013	This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.4.  Main changes in this release are: <ul style="list-style-type: none"><li>• Change of document name from “test specification” to “test plan”</li><li>• LTE interferer for DVB-T and DVB-T2</li><li>• Test cases for RBM in case of reception of DVB-T2 signals. Tests are based on DVB V&amp;V work and harmonized with Ebook and Dbook.</li><li>• Change of DVB-T2 version from 1.1.1 to 1.2.1</li><li>• Reception of DVB-T2 v1.1.1 signals</li><li>• Video, Audio and Subtitling test case updates due removing M2 and M4 requirements.</li><li>• MHP related test cases removed</li></ul>
Ver 2.5.0	01.2016	This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.5.1.  Main changes in this release are: <ul style="list-style-type: none"><li>• Test case and chapter numbering changed</li><li>• Test cases for DVB-T and T2 SSI updated</li><li>• Test cases for DVB-C updated</li><li>• Test cases for PVR updated</li><li>• Test cases for Audio and Video updated</li></ul>
Ver 2.6.0	10.2017	This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.6.0.  Main changes in this release are: <ul style="list-style-type: none"><li>• Test cases for DVB-T/T2 for Analog interference removed</li><li>• Test cases for DVB-T/T2 for LTE interference 800 MHz updated and added for LTE 700 MHz</li><li>• Test cases for IRD System Software and API added</li><li>• Test cases for DVB-T/T2 channel search updated</li><li>• Test cases for DVB-SSU updated</li><li>• Some test cases for PVR functionality updated</li></ul>

## 2 References

This test specification is related to the following documents:

- [1] NorDig Unified Requirements for Integrated Receiver Decoders, Version 2.6 January 2017.
- [2] NorDig Rules of Operation for NorDig Unified receiver networks, ver. 2.5 October 2016.
- [3] HbbTV Test Suite, the most recent released version published by HbbTV applicable to IRD implementing. The most recent released version published by HbbTV refers here to the latest version that was available up to 9 month before the IRD is released/launched, in order to give manufacture time for their QA verification and test process. (Note, HbbTV organisation normally only keep latest version available and at time of writing the latest version is 9.2.0)
- [4] The DVB-T2 Reference Streams, DVB-T2 Verification & Validation Working Group, ver 1.1 (11<sup>th</sup> August, 2011),

## 3 Background

The NorDig group represents broadcasters and network operators in the Nordic countries. The members have agreed on common minimum decoder specifications and a migration plan towards the use of decoders that satisfy these requirements. For further info about NorDig, please see [www.nordig.org](http://www.nordig.org).

The various members of NorDig are independent of each other, but intend to transmit to IRDs that satisfy the specified common minimum requirements. The various networks may in addition specify network specific requirements.

Common test specifications are established in order to ensure that decoders comply with the common minimum requirements. Additional test specifications may apply for individual networks, especially networks with access-controlled transmissions.

The NorDig specifications are contained in the NorDig Unified specification [1] which covers and includes the following profiles; NorDig Basic and NorDig Hybrid. Figure 1 illustrate the relationships between the various NorDig profiles.

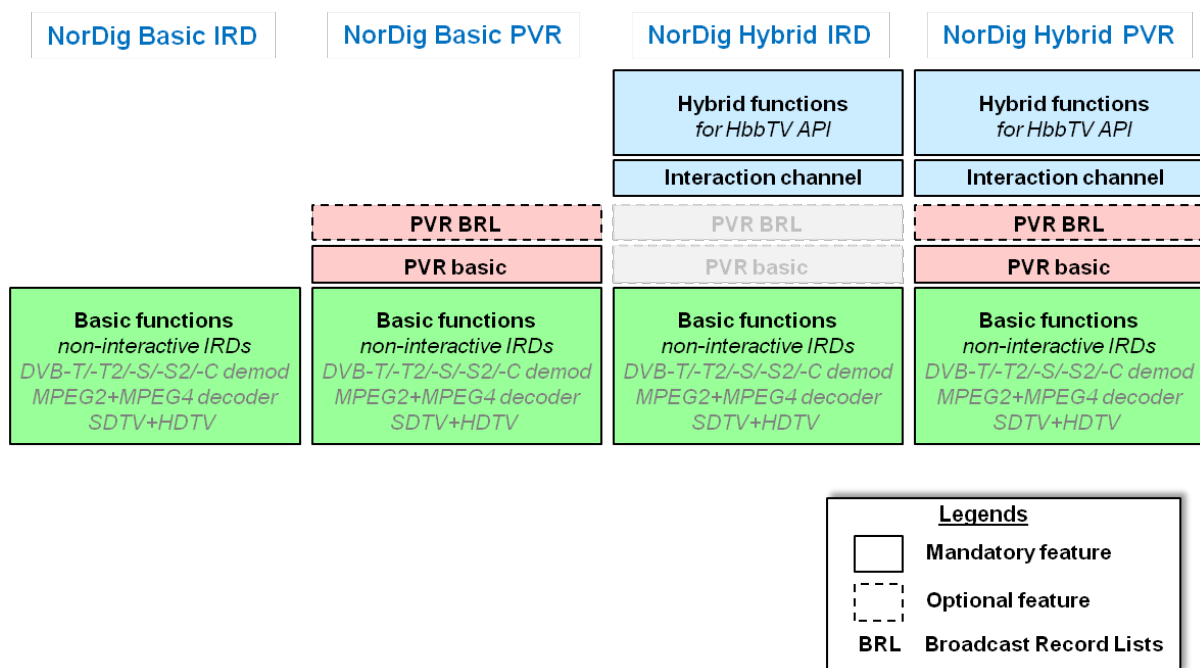

Figure 1 The NorDig profiles and the main building blocks.

## 4 NorDig compliance testing

The NorDig Verification Test is open for all IRD manufacturers that want to claim that they have IRD products that comply with the NorDig IRD requirements. The IRD manufacturer can claim compliance with one or more NorDig profile(s), provided that

- (i) the IRD product complies with the NorDig profile(s)[1] referred to and,
- (ii) the IRD product passes the tests specified in this document.

The NorDig Verification Test shall ensure compliance with the NorDig requirements and NorDig transmissions, and comes in addition to the regular factory testing for general quality and functionality control.

In addition to the common NorDig requirements, the IRD-product has to comply with additional requirements and pass additional tests in case it is intended for use in a network that provides access controlled services. The additional requirements and tests will be available from the relevant Network Custodian.

The IRD Manufacturer shall furthermore contact the relevant Network Custodian(s) in case the IRD product shall be verified for networks with access controlled services. The relevant Network Custodian(s) will provide Network specific requirements (additional to the specified Unified NorDig Requirements) and the corresponding test specifications. Such further handling has to be agreed between the IRD Manufacturer and the relevant Network Custodian (Annex A).

## 5 Test specifications for NorDig compliance

The NorDig Unified test plan consists of test cases and the defined test procedures in each test case are only illustrations of the test setup and the manufacturer can use different setup to run the test cases. If other, than illustrated, test setup is used the manufactures shall describe used test setup in the test report. The defined test sets may not cover all NorDig Unified Requirements [1].

If any requirement in this test specification is in contradictory with the requirement in the specification [1], the requirement in specification [1] is the valid one.

## 6 Testing and test report for NorDig compliance

A Test Report should be made available to show compliance with the common NorDig requirements. Each individual test case should be performed; test results and conformity should be reported and signed.

In each test task a IRD profile is given. This means for which type of receiver the test task is relevant to perform. Following table specifies the abbreviations.

<b>IRD profile</b>	<b>Test task is dedicated for type receiver</b>
Basic	IRD implements NorDig Basic or NorDig Hybrid profile
Hybrid	IRD implements NorDig Hybrid profile
IRD	IRD is either IDTV or STB
IDTV	IRD is either IDTV, CarTV or PCTV
STB	IRD is a STB
FE	IRD implement at least one of the following front-ends: DVB-T,DVB-T2,DVB-C,DVB-S or DVB-S2
DVB-C	IRD with DVB-C tuner
DVB-S	IRD with DVB-S tuner
DVB-S2	IRD with DVB-S2 tuner
DVB-T	IRD with DVB-T tuner
DVB-T2	IRD with DVB-T2 tuner
PVR	IRD implements PVR functionality

In case that the test result indicates a non-compliance (with the specified requirement) the level of the non-compliance shall be evaluated and indicated by ticking the corresponding “box” in the conformity field. If such non-compliance can be removed by an upgrade of the IRD software, this shall be indicated by ticking the correct commentary field for the individual test. The manufacturer should describe the non-compliance and plans to correct it in the “Comments “ row.

The Information specified for the "Test item" should be provided, see section 6.1.

## 6.1 Test item

The information of the Test Item shall be inserted to the following table. The tests shall be performed with the same IRD model (HW/SW) in all test cases.

**Table 6.1 Test Item**

<b>Test Item</b>	
<b>Manufacturer:</b>	
<b>Model:</b>	
<b>S/N(s):</b>	
<b>SW version:</b>	
<b>HW version:</b>	
<b>Front-End:</b>	
<b>Demux:</b>	
<b>Processor:</b>	
<b>Memory size:</b>	
<b>NorDig IRD Profile(s):</b>	
<b>Other relevant information:</b>	

Following information shall be entered to Table 6.1:

<b>Manufacturer:</b>	The name of the manufacturer of the tested IRD
<b>Model:</b>	The model (to be deployed to NorDig market) of the tested IRD
<b>S/N(s):</b>	The serial numbers of all IRDs which are used in the tests
<b>SW version:</b>	The SW version of the tested IRD model
<b>HW version:</b>	The HW version of the tested IRD model
<b>Front-End:</b>	The front-end type and model of the tested IRD
<b>Demux:</b>	The Demux type and model of the tested IRD
<b>Processor:</b>	The Processor type and model of the tested IRD
<b>Memory size:</b>	The memory size of the tested IRD
<b>NorDig Profile</b>	The NorDig profile of the tested IRD
<b>Other relevant information:</b>	The other relevant information that the IRD manufacturer feels important

## 6.2 List of Abbreviations

0b	values written in binary (ie with base 2)
0x	values written in hexadecimal (ie with base 16)
AAC	Advanced Audio Codec
AAC-LC	Advanced Audio Codec Low Complexity
AC-3	Audio Codec 3
ACE	Active Constellation Extension
AFC	Automatic Frequency Control
AFD	Active Format Descriptor
AFNOR	Association Francaise de Normalisation
API	Application Programming Interface
ARC	Audio Return Channel (regarding HDMI interface)
AV	Audio (and) Video
BAT	Bouquet Association Table
BCD	Binary Coded Decimal

NorDig

BDR	Broadcast Discovery Record (part of SD&S)
BER	Bit Error Ratio
BOOTP	Bootstrap Protocol
bslbf	bit string, left bit first
C/N	Carrier to Noise ratio
CA	Conditional Access
CAM	Conditional Access Module
CAT	Conditional Access Table
CATV	Community Antenna Television
CEA	Consumer Electronics Association (North American Association)
CENELEC	Comité Européen de Normalisation Electrotechnique
CI	Common Interface
CID	Content Identifier descriptor
CIF	Common Intermediate Format
CIP- CAM	CA-module that complies with the Common Interface Plus specification
CRC	Cyclic Redundancy Check
CRID	Content Reference Identifier
CSO	Composite Second Order
CTB	Composite Triple Beat
CVBS	Composite Video Baseband Signal
D/A	Digital-to-Analogue converter
DAD	Default Authority Descriptor
DAVIC	Digital Audio-Visual Council
dB	decibel
dBFS	dB (relative to) Full Scale
DDS	Display definition segment
DDWG	Digital Display Working Group
DECT	Digital Enhanced Cordless Telecommunications
DHCP	Dynamic Host Configuration Protocol
DSB	Double SideBand
DSM-CC	Digital Storage Media Command and Control
DTS	Digital Theater System (audio codec)
DVB	Digital Video Broadcasting
DVB-C	Digital Video Broadcasting – Cable
DVB-CAM	CA-module that complies with the DVB Common Interface specification
DVB-data	Digital Video Broadcasting – Data Broadcasting
DVB-S	Digital Video Broadcasting – Satellite
DVB-T	DVB-Terrestrial
E-AC-3	Enhanced Audio Codec 3
E-EDID	Enhanced Extended Display Identification Data (regarding HDMI interface)
EBU	European Broadcasting Union
ECCA	European Cable Communications Association
ECL	EuroCableLabs, technical cell of ECCA
EICTA	European Information & Communications Technology Industry Association
EIT	Event Information Table
EITp/f	Event Information Table, present/following tables
EITsch	Event Information Table, schedule tables
EITp	Event Information Table, present table/section of EITp/f
EITf	Event Information Table, following table/section of EITp/f
EPT	Effective Protection Target
EPG	Electronic Program Guide (based on API)
ESG	Event Schedule Guide (without any API)
FEF	Future Extension Frame

NorDig

FFT	Fast Fourier Transform
GAP	Generic Access Protocol
GOP	Group Of Pictures
GPRS	General Packet Radio System
GS	Generic Stream
GSM	Group Special Mobile
HbbTV	Hybrid Broadcast Broadband TV
HDCP	High-bandwidth Digital Content Protection
HDMI	High-Definition Multimedia Interface
HDMI ARC	HDMI Audio Return Channel
HDTV	High Definition Television
HE-AAC	High Efficiency Advanced Audio Codec
HTTP	HyperText Transfer Protocol
iDTV	integrated Digital TV (IRD with display)
IEC	International Electrotechnical Commission
IEEE	Institute for Electrical and Electronic Engineers
IEFT	Internet Engineering Task Force
IGMP	Internet Group Management Protocol
INA	Interactive Network Adapter
IP	Internet Protocol
IRD	Integrated Receiver Decoder
IMI	Instant Metadata Identifier
ISO	International Organisation for Standardisation
JTC	Joint Technical Committee
LCD	Logical Channel Descriptor
LCN	Logical Channel Number
LU	Loudness Units
LUFS	Loudness Units (relative to) Full Scale
L-PCM	Linear Pulse Code Modulation
MAC	Medium Access Control
MPEG	Moving Pictures Expert Group
MPTS	Multi Programme Transport Stream
MTU	Maximum Transfer Unit
NEM	Network Element Management
NIC	Network Interface Card
NIT	Network Information Table
NT	Network Termination in general
NVOD	Near Video On Demand
OSD	On Screen Display
PAL	Phase Alternating Line
PAPR	Peak-toAverage-Power Ratio
PAT	Program Association Table
PCM	Pulse Code Modulation
PLP	Physical Layer Pipe
PID	Packet Identifier
PMT	Program Map Table
PSI	Program Specific Information
PSTN	Public Switched Telephone Network
PCR	Programme Clock Referance
PVR DVR)	Personal Video Recorder, (same as PDR, Personal Digital Recorder, or
QAM	Quadrature Amplitude Modulation
QCIF	Quarter Common Intermediate Format

**NorDig**

QEF	Quasi Error Free
QoS	Quality of Service
QPSK	Quaternary Phase Shift Keying
RF	Radio Frequency
RFC	Request For Comments
RMS	Root Mean Square
RoO	Rules of Operation
rpchof	remainder polynomial coefficients, highest order first
RS	Reed-Solomon
RST	Running Status Table
RTCP	Real-Time Transport Control Protocol
RTP	Real-Time Transport Protocol
RTSP	Real Time Streaming Protocol
S/PDIF	Sony Philips Digital Interface (for digital audio)
SAP	Session Announcement Protocol
SBR	Spectral Band Replication (regarding HE-AAC audio)
SCART	Syndicat des Constructeurs d'Appareils Radiorécepteurs et Téléviseurs (video/audio interface)
SD&S	Service Discovery and Selection
SDT	Service Description Table
SDTV	Standard Definition Television
SFN	Single Frequency Network
SI	Service Information
SMATV	Satellite Master Antenna Television
SNTP	Simple Network Time Protocol
SPTS	Single Programme Transport Stream
ST	Stuffing Table
STB	Set-top box (IRD without display)
SW	Software
TCP	Transmission Control Protocol
TDT	Time and Date Table
TFS	Time Frequency Slicing
TFTP	Tunnelling File Transfer Protocol
TOT	Time Offset Table
TPS	Transmission Parameter Signalling
TRS	Tip Ring Sleeve
TR	Tone Reservation
TS	Transport Stream
TV	Television
TVA	TV Anytime
UHF	Ultra-High Frequency
uimsbf	unsigned integer most significant bit first
UTC	Universal Time, Co-ordinated
VCR	Video Cassette Recorder
VHF	Very-High Frequency
VHS	Video Home System
VoIP	Voice over IP
VPN	Virtual Private Network
VSF	Vestigial SideBand
xDSL	x Digital Subscriber Line
XML	Extensible Markup Language

## **Part II - Test Cases**

NorDig

## 1 Introduction - Test Cases

The NorDig plan specifications Test Cases are grouped into a set of test tasks, covering related tests:

- Task 1: Satellite tuner and demodulator
- Task 2: Cable Tuner and Demodulator
- Task 3: Terrestrial Tuner and Demodulator
- Task 4: IP-Based Front-end
- Task 5: MPEG2 demultiplexer
- Task 6: Video
- Task 7: Audio
- Task 8: Teletext and subtitling
- Task 9: Interfaces and Signal Levels
- Task 10: Interfaces for Conditional Access
- Task 11: The System Software Update
- Task 12: Performance
- Task 13: Service Information
- Task 15: PVR Functionality
- Task 16: IRD System Software and API
- Task 17: User Preferences

Each of the main tasks defined above include a number of sub-tasks.

Table 1 maps the NorDig requirements [1] into the corresponding test tasks and shows the relevance per sub-task for the various NorDig profiles (“shall” indicates a mandatory requirement and a mandatory test).

NorDig

**Table 1A. Task A: Front ends**

NorDig Test Task	NorDig IRD Profile

## 2 Test Plan for NorDig - Test Cases

### 2.1 Task 1: Satellite tuner and demodulator

#### 2.1.1 QEF Quality Measurement Methods

If the received signal is above  $C/N$  and  $C/I$  threshold, the Forward Error Correction (FEC) technique adopted in the System is designed to provide a "Quasi Error Free" (QEF) quality target. The QEF means less than one uncorrected error-event per transmission hour, corresponding to Bit Error Ratio (BER) =  $10^{-10}$  to  $10^{-11}$  at the input of the MPEG-2 demultiplexer.

If the received signal is above the  $C/N+I$  threshold, the Forward Error Correction (FEC) technique adopted in the System is designed to provide a "Quasi Error Free" (QEF) quality target. The definition of QEF adopted for DVB-S2 is "less than one uncorrected error-event per transmission hour at the level of a 5 Mbit/s single TV service decoder", approximately corresponding to a Transport Stream Packet Error Ratio  $PER < 10^{-7}$  before demultiplexer.

In practice, it takes long time to measure such a low PER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-S system, or BER after LDPC in DVB-S2 system
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-S system, the BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of  $10^{-11}$  measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect objective method in the DVB-S2 system the BER of  $10^{-7}$  after LDPC decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels.

#### Direct objective quality measurement procedure in DVB-S and DVB-S2 systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value  $10^{-10}$ - $10^{-11}$  at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

#### Indirect subjective quality measurement procedure 1 (QMP1) in DVB-S and DVB-S2 systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

#### Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-S system

The measurement can be performed either by using

1. the embedded BER after Viterbi measurement provided by the receiver ,or
2. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value  $2 \cdot 10^{-4}$  .The integrated BER after Viterbi measurement value  $2 \cdot 10^{-4}$  shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than  $2 \cdot 10^{-4}$  , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to  $2 \cdot 10^{-4}$  , Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to  $2 \cdot 10^{-4}$  is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-S2 system

The measurement can be performed either by using

1. the embedded BER after LDPC measurement provided by the receiver, or
2. watching the decoded video for **30 seconds**.

If the BER after LDPC measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after LDPC decoder value  $10^{-7}$ . In case of higher BER after LDPC value than  $10^{-7}$  , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after LDPC which is lower than or equal to  $10^{-7}$  , Otherwise, the change of the measurement configuration parameters is repeated until the BER after LDPC value lower than or equal to  $10^{-7}$  is achieved. That reception shall be verified that it corresponds an **error free video** decoding.

If the **30 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **30 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **30 seconds**.

Due to the nature of the DVB-S2 system forward error correction schemes the difference for the 30 seconds error free video and BER  $10^{-7}$  after LDPC is very low. For practical testing the performance values are equal for both quality levels.

The corresponding measurement values for profile and DVB-S / DVB-S2 mode shall be achieved from tables below.

		C/N ( $E_s/N_0$ ) performance (dB)	
Modulation	Code Rate	DVB-S	DVB-S2
QPSK	1/4	n/a	-1.4
QPSK	1/3	n/a	-0.2
QPSK	2/5	n/a	0.7
QPSK	1/2	3.8	2.0
QPSK	3/5	n/a	3.2

QPSK	2/3	5.6	4.1
QPSK	3/4	6.7	5.0
QPSK	4/5	n/a	5.7
QPSK	5/6	7.7	6.2
QPSK	7/8	8.4	n/a
QPSK	8/9	n/a	7.2
QPSK	9/10	n/a	7.4
8PSK	3/5	n/a	6.5
8PSK	2/3	n/a	7.6
8PSK	3/4	n/a	8.9
8PSK	5/6	n/a	10.4
8PSK	8/9	n/a	11.7
8PSK	9/10	n/a	12.0

### 2.1.2 Test cases

<b>Test Case</b>	<b>Task 1:1 General</b>		
<b>Section</b>	NorDig Unified 3.1.1		
<b>Requirement</b>	The NorDig IRD shall include at least one tuner/demodulator unit for reception of signals from a satelliteRF-outdoor unit.		
<b>IRD Profile(s)</b>	Basic, IRD, DVB-S, DVB-S2		
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD contains at least one Tuner/demodulator</p> <p><b>Equipment:</b> IRD Under test</p> <p><b>Test procedure:</b> This is common requirement and will be verified in the following tests.</p>		
<b>Test result(s)</b>			
<b>Conformity</b>	<input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments		
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information		
<b>Date</b>		<b>Sign</b>	

<b>Test Case</b>	<b>Task 1:2 General</b>	
<b>Section</b>	NorDig Unified 3.1.2	
<b>Requirement</b>	The NorDig IRD shall be able to automatically scan through the whole frequency range available for each of the available Tuners/Demodulators and tune in to the correct DVB framing structure, channel coding and modulation to deliver the incoming transport stream to the next units. The tuning data shall be stored in a service list, in order to allow a quick tune in to the selected transport stream.	
<b>IRD Profile(s)</b>	Basic, IRD, DVB-S, DVB-S2	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD is able to scan through the whole frequency range.</p> <p><b>Test procedure:</b> This is common requirement and will be verified in the following tests.</p>	
<b>Test result(s)</b>	The manufacturer describes his specific setup for the test	
<b>Conformity</b>	<input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 1:3 Quality reception detector</b>	
<b>Section</b>	NorDig Unified 3.1.3	
<b>Requirement</b>	The NorDig Unified receiver shall be equipped with a reception quality detector.	
<b>IRD Profile(s)</b>	Basic, IRD, DVB-S, DVB-S2	
<b>Test procedure</b>	<p><b>Equipment:</b> Test signal are created using the test bed shown below:</p> <div style="text-align: center;">  <pre> graph LR     A[MPEG 2-source] --&gt; B[DVB-S Modulator]     B --&gt; C[Up Converter]     C --&gt; D[DVB Receiver]     D --&gt; E[Monitor]           </pre> </div> <p><b>Test procedure:</b> Check that the IRD is equipped with a reception quality detector</p> <p><b>Expected result:</b> It shall be possible to access some kind of a reception quality detector</p>	
<b>Test result(s)</b>

<b>Test Case</b>	<b>Task 1:11 Input Signal Level</b>				
<b>Section</b>	NorDig Unified 3.2.7.2				
<b>Requirement</b>	The NorDig IRD shall accept input signals with a level in the range -25 to -60 dBm.				
<b>IRD Profile(s)</b>	Basic, IRD, DVB-S, DVB-S2				

**Test procedure**

**Purpose of test:**

To verify that the receiver can receive input signals with a level in the range -25 to -60 dBm.

**Equipment:**

Test signals are created using the test bed shown below:

**Test procedure:**

1. Configure wanted signal to IF frequency 965 MHz, DVB-S QPSK, FEC=7/8, 30Mbaud at level -60dBm.
2. Power on IRD.
3. Make a channel search at wanted signal.
4. Verify that IRD locks to carrier and decodes picture without any visible degradation (meets QMP2).
5. Increase the wanted signal level to -25dBm.
6. Verify that IRD locks to carrier and decodes picture without any visible degradation (meets QMP2).

Repeat the test for the centre frequencies and modes in the measurement record.

**Expected result:**

IRD decodes picture and sound without any visible degradation.

**Test result(s)**

## 2.2 Task 2: Cable Tuner and Demodulator

### 2.2.1 QEF Quality Measurement Methods

The quality limit in this specification is defined as Quasi Error Free (QEF) reception, where QEF means less than one uncorrected error event per hour. The definition of QEF corresponds to BER of  $10^{-11}$  in the TS data at input of the MPEG-2 demultiplexer. In practice, it takes long time to measure such a low BER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-C system, or
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-C system, the BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of  $10^{-11}$  measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect subjective measurement method the certain period of time of error free video decoding is considered to corresponds to a good reception quality. The specified video test sequence can be any containing movement everywhere, in order to minimise the number of errors not being observed due to error concealment techniques in the receiver. Such a relevant video sequences are e.g. 'Mobile and calendar' and 'Zoneplate'.

The result of the indirect quality measurements may differ. Therefore, the method that shall be used is specified in every test case. However, the reception quality shall be verified by using the subjective measurement method for every test case. The measurement methods (procedures) are defined below.

#### Direct objective quality measurement procedure in DVB-C systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value  $10^{-11}$  at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

#### Indirect subjective quality measurement procedure 1 (OMP1) in DVB-C systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-C system

The measurement can be performed either by using

3. the embedded BER after Viterbi measurement provided by the receiver ,or
4. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value  $2 \cdot 10^{-4}$  .The integrated BER after Viterbi measurement value  $2 \cdot 10^{-4}$  shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than  $2 \cdot 10^{-4}$  , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to  $2 \cdot 10^{-4}$  , Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to  $2 \cdot 10^{-4}$  is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

**2.2.2 Test cases**

<i>Test Case</i>	<b>Task 2:1 General</b>	
<i>Section</i>	NorDig Unified 3.1.1	
<i>Requirement</i>	The NorDig IRD shall contain at least one Tuner/Demodulator for cable DVB/MPEG 2 signals.	
<i>IRD profile(s)</i>	Basic, IRD, DVB-C	
<i>Test procedure</i>	<p><b>Purpose of test:</b> To verify that IRD contains at least one Tuner/demodulator</p> <p><b>Equipment:</b> IRD Under test.</p> <p><b>Test procedure:</b> This is common requirement and will be verified in the following tests.</p>

	<b>Task 2:15 RF Performace - C/N with echo</b>
<b>Section</b>	NorDig Unified 3.3.5.4
<b>Requirement</b>	The NorDig IRD shall perform as specified in Table 3.3, plus an allowance of 1 dB when an echo is applied in accordance to the template in Figure 3.1.
<b>IRD profile(s)</b>	Basic, IRD, DVB-C

**Test procedure**

**Purpose of test:**

To verify the required C/N when echoes are present.

**Equipment:**

**Test procedure:**

1. Set up the test instruments
2. Use the following settings {256 QAM, SR=6.952, 666 Mhz, delay 0 ns}
3. Measure the input level to the attenuator.
4. Determine the attenuation of the attenuator and the cables.
5. Calculate the receiver input signal level and set it to 54dB $\mu$ V.
6. Use the value for the required C/N+1 dB specified in table 3.4 in NorDig Unified specification [1].
7. Do the channel search.
8. Increase the C/N from low value to higher value until the quality measurement procedure 2 fulfils.
9. Fill in the measured value in dB in the measurement record.
10. Repeat the test for the rest of the modes and delays defined in the measurement record.

**Expected result:**

The measured C/N shall be within required C/N + 1 dB.

<b>Test Case</b>	<b>Task 2:16 Performance Data: Noise figure</b>
<b>Section</b>	NorDig Unified 3.3.5.1
<b>Requirement</b>	The performance data below shall be satisfied: Noise figure: less than 8 dB.
<b>IRD profile(s)</b>	Basic, IRD, DVB-C

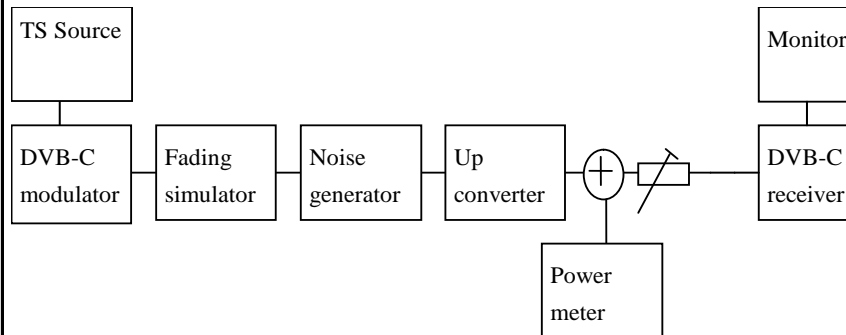

**Test procedure**

**Purpose of test:**

To verify the receiver noise figure performance.

**Equipment:**

**Test procedure:**

1. Set up the test instruments
2. Use the following settings {256 QAM, SR=6.952 , roll-off 0.15}.
3. Use the channel K45 (666 MHz)
4. Measure the input level to the attenuator.
5. Determine the attenuation of the attenuator and the cables.
6. Calculate the receiver input signal level and set it to 59 dB $\mu$ V.
7. Do the channel search.
8. Increase the C/N from low value to higher value until the quality measurement procedure 2 fulfills.
9. Fill in the measured C/N value in dB in the measurement record.
10. Shutdown added noise.
11. Decrease the signal input level to such a level that receiver is not able to provide picture.
12. Increase the signal input level to receiver until the quality measurement procedure 2 fulfills.
13. Fill in the sensitivity P<sub>min</sub> value in dB $\mu$ V in measurement record.
14. Repeat the test for the rest of the frequencies defined in the measurement record.
15. Calculate the NF using formula: NF[dB] = P<sub>min</sub> - C/N - 3.8 dB $\mu$ V

**Expected result:**

Noise figure is lower than 8dB.

**Test result(s)**

Measurement record:

	f [MHz]						
	114	210	282	386	474	666	858
C/N [dB]							
P <sub>min</sub> [dB $\mu$ V]							
NF [dB]

	<b>Task 2:19 RF Performance – Analog Adjacent Channel</b>		
<b>Section</b>	NorDig Unified 3.3.5.6 and 3.3.5.7		
<b>Requirement</b>	<p>The NorDig IRD shall perform as specified in section 3.3.5.3 with</p> <ol style="list-style-type: none"> <li>c) Digital signals at 0dBc in the adjacent channels.</li> <li>d) Analogue signals at +10dB in the adjacent channels</li> </ol> <p>The NorDig IRD shall perform as specified in section 3.3.5.3, plus an allowance of 0.2 dB with digital signals at +10dBc in adjacent channels.</p>		
<b>IRD profile(s)</b>	Basic, IRD, DVB-C		

**Test procedure**

**Purpose of test:**

To verify that IRD can operate with required adjacent channels

**Test procedure:**

1. Set up the test instruments
2. Use the following PAL signal: Colour bar 75%
3. Insert 12 lines of Teletext.
4. Modulate the FM sound carrier with 1kHz ton to deviation of 50 kHz.
5. Verify that the signal levels of the DVB-C signal and the analogue signal are correct e.g. by using the spectrum analyser.
6. Adjust the level of the FM carrier to -13 dB relative to the vision carrier
7. Adjust the level from NICAM modulator to -20 dB relative to the vision carrier.
8. Use the following DVB-C mode: { 256 QAM, SR=6.952 @ 77 dB $\mu$ V }.
9. Set the upconverter (wanted) for DVB-C carrier to 666.0MHz
10. Set the upconverters (interference) for analog TV carrier to frequency n-1 (658MHz) and n+1 (674 MHz)
11. Set the receiver input levels for the analog TV signals to 77 dB $\mu$ V.
12. Apply Gaussian noise to the wanted signal.
13. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) fulfills.
14. Fill in the measured C/N value in dB in the measurement record.
15. Repeat the test for the DVB-C modes and signal levels in the measurement record.

**Expected result:**

The measured C/N shall be within required C/N + allowances.

## 2.3 Task 3: Terrestrial Tuner and Demodulator

### 2.3.1 Test equipment summary

To configure the minimum test setups described in these test procedures the following functionalities are needed:

Video and audio source (MPEG-2)  
Re-multiplexers  
Broadband Fading simulator  
Noise generator  
DVB-T/T2 Exciter (DVB-T/T2 modulator and up-converter)  
Analog TV RF Exciter with PAL, NICAM and teletext generator.

DVB-T or DVB-T2 receiver with RF input  
Transport stream analyzers  
Power meter with thermo coupled 50ohm and 75ohm power sensor  
Video monitor

Note! The needed instruments may vary depending on the used system and can be purchased from many vendors in a compact all-in-one units. Different test setups are defined in every test case. However, most of the tests can be done using one general test setup.

### 2.3.2 QEF Quality Measurement Methods

The quality limit in this specification is defined as Quasi Error Free (QEF) reception, where QEF means less than one uncorrected error event per hour. The definition of QEF corresponds to BER of  $10^{-11}$  in the TS data at input of the MPEG-2 demultiplexer. In practice, it takes long time to measure such a low BER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-T system, or measuring the BER after LDPC in DVB-T2 system, or
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-T system, the BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of  $2 \cdot 10^{-4}$  after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of  $10^{-11}$  measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect objective method in the DVB-T2 system the BER of  $10^{-7}$  after LDPC decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels.

In the indirect subjective measurement method the certain period of time of error free video decoding is considered to correspond to a good reception quality. The specified video test sequence can be any containing movement everywhere, in order to minimise the number of errors not being observed due to error concealment techniques in the receiver. Such a relevant video sequences are e.g. 'Mobile and calendar' and 'Zoneplate'.

The result of the indirect quality measurements may differ. Therefore, the method that shall be used is specified in every test case. However, the reception quality shall be verified by using the subjective measurement method for every test case. The measurement methods (procedures) are defined below.

#### Direct objective quality measurement procedure in DVB-T and DVB-T2 systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value  $10^{-11}$  at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

#### Indirect subjective quality measurement procedure 1 (QMP1) in DVB-T and DVB-T2 systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

#### Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-T system

The measurement can be performed either by using

5. the embedded BER after Viterbi measurement provided by the receiver ,or
6. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value  $2 \cdot 10^{-4}$ . The integrated BER after Viterbi measurement value  $2 \cdot 10^{-4}$  shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than  $2 \cdot 10^{-4}$ , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to  $2 \cdot 10^{-4}$ , Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to  $2 \cdot 10^{-4}$  is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

The corresponding measurement value for profile and DVB-T mode shall be achieved from tables below.

Modulation	Code rate	C/N performance (dB)

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-T2 system

The measurement can be performed either by using

3. the embedded BER after LDPC measurement provided by the receiver, or
4. watching the decoded video for **30 seconds**.

If the BER after LDPC measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after LDPC decoder value  $10^{-7}$ . In case of higher BER after LDPC value than  $10^{-7}$ , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after LDPC which is lower than or equal to  $10^{-7}$ . Otherwise, the change of the measurement configuration parameters is repeated until the BER after LDPC value lower than or equal to  $10^{-7}$  is achieved. That reception shall be verified that it corresponds an **error free video** decoding.

If the **30 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **30 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **30 seconds**.

Due to the nature of the DVB-T2 system forward error correction schemes the difference for the 30 seconds error free video and BER  $10^{-7}$  after LDPC is very low. For practical testing the performance values are equal for both quality levels.

The corresponding measurement value for profile and DVB-T2 mode shall be achieved from tables below.

Modulation	Code rate	C/N performance (dB) for PP2

Table 2.8 Minimum DVB-T2 signal input levels (Pmin) for “30 seconds error free video” and BER 1E-7 after LDPC for PP2 and for any allowed combination of guard interval, signal bandwidth, FFT size and extended carrier mode. Values are equal for normal carrier mode except for 8MHz signal BW where 0.1dB is subtracted. Before 1.1.2012 the values for non-S-band channels may be increased with 1 dB, excluding 1.7MHz bandwidth columns, due to a 1 dB relaxation in noise figure.

**Table 2.11** Minimum DVB-T2 signal input levels (Pmin) for “30 seconds error free video” and BER 1E-7 after LDPC for PP7 and for any allowed combination of guard interval, FFT size and extended carrier mode. Values are equal for normal carrier mode except for 8MHz signal BW where 0.1dB is subtracted. Before 1.1.2012 the values for non-S-band channels may be increased with 1 dB, excluding 1.7MHz bandwidth columns, due to a 1 dB relaxation in noise figure.

### 2.3.3 Bitrates

The different DVB-T/T2 modes define different bitrates for the transport stream. The following table defines the bitrates for the transport stream in Mbit/s. For DVB-T2 bit rate calculation combination highest time interleaving depth and highest number of symbols per frame resulting highest bit rate is used.

8MHz, 2k / 8k					
Modulation	FEC	Tg=1/32	Tg=1/16	Tg=1/8	Tg=1/4
QPSK	1/2	6.032086	5.854671	5.529412	4.976471

**Table 2.16 Bitrates for the transport stream in Mbit/s for 1.7MHz DVB-T2 signal bandwidth.**

The video and audio compression technique of the content within transport stream doesn't have any influence to RF performance test results. Therefore, following content compression with given bit rate applies for all tests excluding DVB-T2 receiver buffer model tests where requirement for lower transport stream bit rate is necessary in order to stress the receiver buffer correctly.

Normal test content conditions:

The used video is MPEG-2 elementary stream in resolution 720x576. The video bitrate within transport stream is 4.0 Mbit/s.

The used audio is MPEG-1 elementary stream in stereo mode. The audio bitrate is 128kbit/s per channel.

Test tasks Task 3:41, Task 3:42, Task 3:43 and Task 3:46:

A transport stream bit rate shall be equal or below 3.3 MBit/s. Video and audio content carried within transport stream shall be selected so that transport stream bit rate condition is met.

### 2.3.4 Receiver operability in SFN

The SFN synchronisation of the receiver depends on the echo delay and attenuation level in the SFN. The SFN synchronisation of the receiver may also depend of the state of the receiver. Therefore, it is important to evaluate if the receiver synchronises differently in the following situations:

1. When the receiver is restarted completely (AC cord disconnected).
2. When the receiver is powered on in standby mode. The last good SFN synchronisation parameters can be saved to memory for faster SFN synchronisation leading that the dynamical change of the delay during the receiver is in standby mode gives bad result on power up.
3. During the channel search.
4. Connecting and disconnecting the input RF signal (closing and opening of the RF switch as in test cases). Discontinued input RF signal tests the SFN synchronisation algorithm when the receiver is forced to an unlocked state, e.g. when transmission is discontinued.
5. Zapping between services on different frequencies. Different frequencies have different echo delays and attenuation levels. This corresponds the real reception.
6. During the over-the-air software upgrade. If the demodulator is not correctly controlled during the software download, the SFN synchronisation problems can lead that the software cannot be updated.

Evaluation of the SFN synchronisation can be done e.g. when an echo delay and amplitude level combination is founded to be difficult to synchronise. In that case methods above are tested. Decide which method can be used to evaluate the SFN synchronisation algorithm of the receiver. Check also that all the other methods work. Independently of the state of the receiver all the listed methods above shall work.

The receiver shall detect correct synchronization in SFN, maintain it and provide reception quality at required quality level independently if the received signal changes from bad conditions to good conditions or vice versa. E.g. when testing and finding the required C/N in test cases, the receiver must be able to detect correct synchronization in SFN, maintain it and provide reception quality at defined quality level when C/N value is changed from low (bad reception condition) value to higher (better reception condition) value.

### 2.3.5 0dB echo

The 0 degree channel center shall be used in fading simulator. In this context it means that the carriers from the direct and echo signal are cumulative. See figure below for 0dB 1.95 $\mu$ s echo.

### 2.3.6 Conditions for analogue TV

The level of the analog TV signal is defined to be the power during the sync pulse of the vision carrier. The power of the sync pulse of the vision carrier shall be measured when the video input of the analogue TV modulator is connected to 75ohm load, in other words, there is no modulation in the vision carrier. 10% modulation depth is used for vision carrier.

The level of the FM sound relative to the vision carrier is -13 dB. The frequency of FM sound carrier is +5.5 MHz relative to vision carrier.

The level of the NICAM signal relative to the vision carrier is -20 dB. The frequency of the NICAM carrier is +5.85MHz relative to vision carrier.

It shall be verified that the analog TV signal doesn't have too high out-of-band emissions, which could cause interference to other frequencies.

The equipment used for generation of the analog TV shall be connected to same frequency reference signal as the digital TV equipment.

### **2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks**

Manufacture shall ensure the functionality of the receiver in all required DVB-T2 parameter settings specified in (1). Also, manufacture shall ensure the performance as required in (1) for the subset of the DVB-T2 modes although in test cases the amount of the DVB-T2 may have been reduced in order to minimise the test time.

Summary of mandatory parameters settings for single and multiple PLP DVB-T2 modes are listed in Table 2.16 and Table 2.17 used in DVB-T2 test tasks. In every test case any deviations to the common parameters are specified.

85 (457)

NorDig Unified Test plan, ver 2.6.0

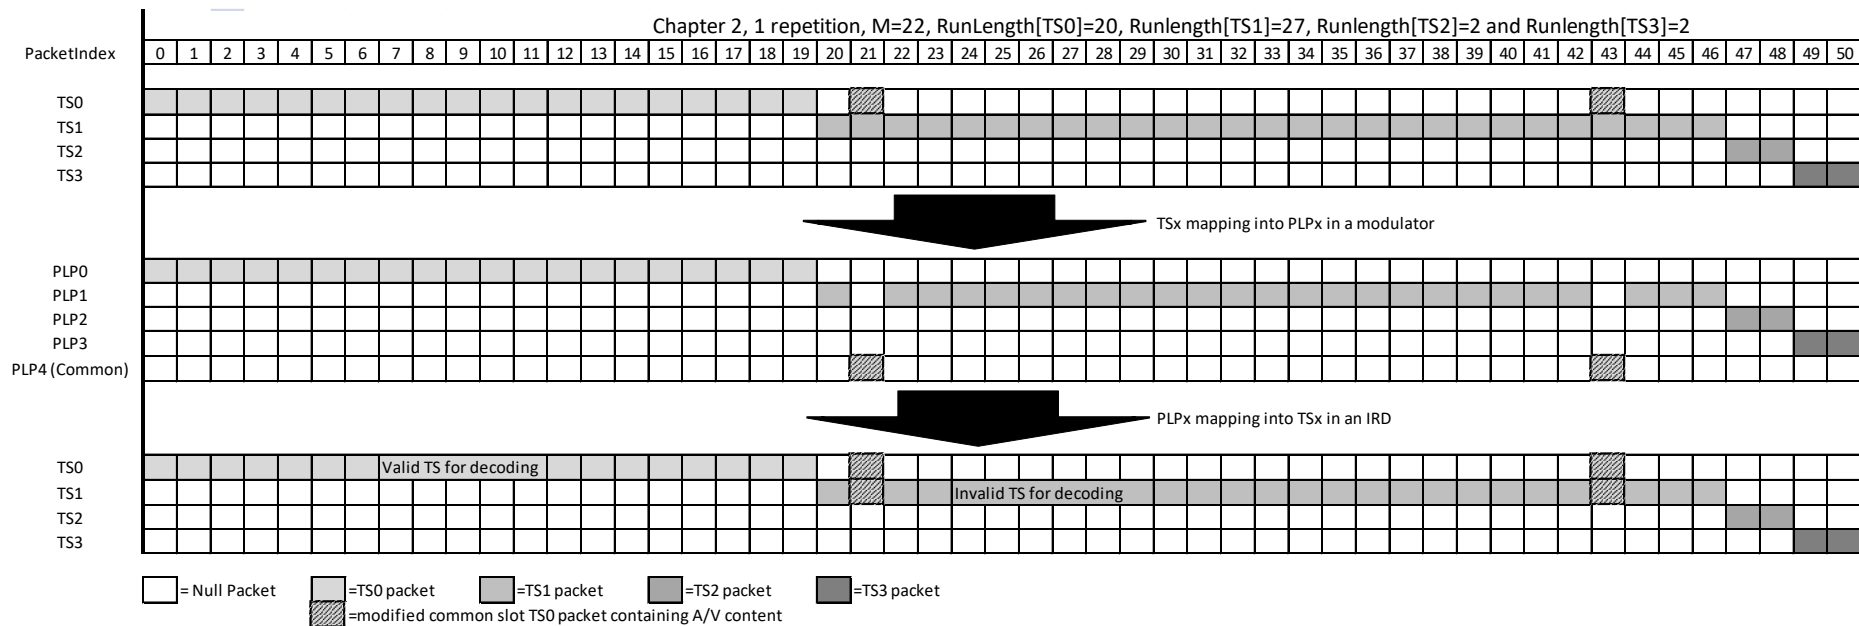

Due to the deployment situation for DVB-T2 transmissions in networks is different, several alternatives for  $L_f$  and FEC blocks / interleaving frame are given.

Normally signal bandwidth of the DVB-T2 mode is specified for the on-air signals on VHF and UHF frequencies. For off-air signals in cable networks the signal bandwidth relation to frequency band is not obvious, e.g. when reception from on-air 8MHz signal bandwidth on UHF is downconverted to VHF off-air distribution.

### 2.3.8 Stream packet structure in Receiver Buffer Model (RBM) tests for DVB-T2

Test tasks Task 3:41, Task 3:42, Task 3:43 and Task 3:46 stress the receiver buffer model. TS contains a service with a real video and audio. Prerequisite is that the modulator shall support V&V packet generation architecture. Figure 2 shows Task 3:41 chapter 2 packet structure. Compilation of the TSs to PLPs and recompilation back to TSs are explained more detailed in [4]. Video and audio content carried within common PLP is used for test purposes in order to make it possible to test IRD subjectively. Most probably that is not a normal use of common PLP although common PLP allows contain video and audio content. To make sure broadcast network operator's use of common PLP, the broadcast network operator should be consulted.

Defined RBM test method can only test one PLP at a time, therefore the RBM tests have to be run with a separate stream for each PLP to be tested.

**Figure 2. Example of compilation of Task 3:41 TSs to PLPs and recompilation back to TSs. Figure shows only chapter 2 where repetition is 1 for a modulator supporting V&V stream compilation and IRD demodulating the received DVB-T2 signal. The recompiled TS0 results to a valid TS for decoding.**

### 2.3.9 Test cases

#### 2.3.9.1 Test cases – DVB-T IRD

<b>Test Case</b>	<b>Task 3:1 General</b>	
<b>Section</b>	NorDig Unified 3.4.1	
<b>Requirement</b>	The NorDig IRD shall include at least one tuner/demodulator for reception of signals from terrestrial transmitters, broadcasting in accordance with EN 300 744 [21] (DVB-T).	
<b>IRD profile(s)</b>	Basic, IRD, DVB-T	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the possibility of the reception of the DVB-T signal.</p> <p><b>Equipment:</b> An IRD.</p> <p><b>Test procedure:</b> Make sure that the IRD has one tuner/demodulator for reception of terrestrial signals.</p> <p><b>Expected result:</b> IRD has one tuner/demodulator for terrestrial reception.</p>	
<b>Test result(s)</b>		
<b>Conformity</b>	<input type="checkbox"/> <b>OK Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 3:2 General</b>	
<b>Section</b>	NorDig Unified 3.1.2	
<b>IRD profile(s)</b>	Basic, IRD, DVB-T	
<b>Requirement</b>	The NorDig IRD shall be able to automatically scan through the whole frequency range available for each of the available Tuners/Demodulators and tune in to the correct DVB framing structure, channel coding and modulation to deliver the incoming transport stream to the next units. The tuning data shall be stored in a service list, in order to allow a quick tune in to the selected transport stream. For more detail see below.	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD is able to scan through the whole frequency range.</p> <p><b>Test procedure:</b> This is common requirement and will be verified in the following tests.</p>	
<b>Test result(s)</b>	The manufacturer describes his specific setup for the test	
<b>Conformity</b>	<input type="checkbox"/> <b>OK Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 3:3 Quality reception detector</b>	
<b>Section</b>	NorDig Unified 3.1.3	
<b>Requirement</b>	The NorDig Unified receiver shall be equipped with a reception quality detector.	
<b>IRD profile(s)</b>	Basic, IRD, DVB-T	
<b>Test procedure</b>	<p><b>Equipment:</b> IRD under test.</p> <p><b>Test procedure:</b> Check that the IRD is equipped with a reception quality detector</p> <p><b>Expected result:</b> It shall be possible to access some kind of a reception quality detector.</p>	
<b>Test result(s)</b>		
<b>Conformity</b>	<input type="checkbox"/> <b>OK Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 3:4 Frequencies: Center frequencies</b>	
<b>Section</b>	NorDig Unified 3.4.2.1 and 3.4.2.2	
<b>Requirement</b>	<p>The NorDig IRD shall be able to receive channels in VHF band III and UHF bands IV, V and should be able to receive channels in VHF S band I, VHF S band II, UHF S Band III.</p> <p>The front-end shall for the supported frequency ranges be capable of tuning to the center frequency <math>f_c</math> of the incoming DVB-T RF signal, see below.</p> <p>8MHz raster: <math>f_c = 114 \text{ MHz} + K * 8 \text{ MHz}</math>, where <math>K = 0 \dots 93</math>          7MHz raster: <math>f_c = 107.5 \text{ MHz} + L * 7 \text{ MHz}</math>, where <math>L = 0 \dots 27</math></p>	
<b>IRD profile(s)</b>	Basic, IRD, DVB-T	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the reception over the supported frequency range.</p> <p><b>Equipment:</b></p> <pre> graph LR     A[MPEG-2 source] --- B[DVB-T modulator]     B --- C[Up-converter]     C --- D[DVB-T Receiver]     D --- E[Monitor]           </pre> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Set up the test instruments</li> <li>2. Use the following mode 8k 64QAM, HP Code rate=2/3, Guard interval <math>T_U/8</math></li> <li>3. Use input level of -60 dBm</li> <li>4. Start with frequency 177,5MHz (K5)</li> <li>5. Use the quality measurement procedures 1 (QMP1).</li> <li>6. Fill the result in the measurement record: <b>OK</b> or <b>NOK</b>.</li> <li>7. Repeat the test for all channels in the table 1 in the measurement record.</li> </ol>	

8. If the receiver supports optional frequency ranges, test all remaining channels in table 2 and 3 in the measurement record.

**Expected result:**

The result of the test shall be OK for all channels in table 1.

For the optionally supported frequency ranges, the tests shall be OK for the channels in the tables 2 and 3.

<b>Test Case</b>	<b>Task 3:10 Tuning/Scanning Procedures: Automatic channel search for the same service bouquet</b>
<b>Section</b>	NorDig Unified 3.4.4.4
<b>Requirement</b>	<p>The terrestrial NorDig IRD shall provide an automatic search that finds all of the multiplexes and services in the whole (supported) frequency range, see NorDig specification. The logic of the automatic search function shall be as follows:</p> <ul style="list-style-type: none"> <li>If any services are detected during the automatic search the current service list shall be replaced by the new service list.</li> <li>If no services are detected during the automatic search the current service list shall be kept or deleted.</li> </ul> <p>The IRD shall only display a service once in the service list (i.e. avoiding duplicate of the same services), even if the same service (same triplet original_network_id, transport_stream_id and service_id) is received from multiple transmitters. If the same service can be received from several transmitters, the one with best reception quality shall be selected. The criteria for selection of the best received service (i.e. best reception quality) shall be based on the combination of the signal strength and signal quality according to NorDig specification.</p>
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the best service selection in automatic channel search when the content of the transport stream is the same on several transmitters.</p> <p><b>Equipment:</b></p>

**Channels A and B**

**TS source #1**

**ONID=8945**

**Network ID=1000**

**Network Name=Net1**

**TSID=100**

**Services**

Name	SID	Logic Ch No
S1	1	1
S2	2	2
S3	3	3
S4	4	4

There is a possibility to receive broadcasts from several transmitters simultaneously in DVB-T network. These transmitters can have exactly the same content, but are transmitted on different channels (frequencies). Therefore, it is important that the receiver can choose by an automatic channel search the services with the best reception quality.

Test to verify broadcast where equal services are broadcasted simultaneously over DVB-T and DVB-T2 networks is not required.

Reception quality can be divided into two different parameters:

- Signal strength
- Signal quality

Signal quality can be divided into two main parameters:

- Signal-to-noise ratio (C/N)
- Bit error rate before Reed Solomon (BER before RS in DVB-T system)

Channels A and B shall not be equal.

Relative signal levels can be observed on spectrum analyser.

$\Delta S$  refers to difference in SSI according to [1] Annex D.

$\Delta Q$  refers to difference in SQI according to [1] Annex D.

AWGN refers to Additive White Gaussian Noise.

Test points 10-13 in table 20 below require the BER in each channel to be set in a specific way. Different signal generators provide different methods to degrade the signal. For example carriers can be disabled, or I/Q quadrature error introduced to achieve a specific BER.

As a pre-requisite to perform this test, IRD shall correctly pass the following tasks:

- Task 3:13 Verification of Signal Strength Indicator (SSI)
- Task 3:14 Verification of Signal Quality Indicator (SQI)

Measurement record 2 shows the minimum tests that shall be performed. Signal levels and signal quality (i.e added AWGN or additional BER impairments) can be adjusted from the initial values shown to ensure the required  $\Delta S$  and  $\Delta Q$  conditions are met.

**Test procedure:**

1. Configure the transport stream and setup the instruments. Use the DVB-T mode 8k 64QAM R=2/3  $\Delta/Tu=1/8$ .
2. Set the signal level of the both carriers CH A and CH B to the same level. The signal level shall correspond good reception quality (no errors in decoded video).
3. Perform automatic channel search. The logic of the automatic search function shall be as follows:
  - If any services are detected during the automatic search the current service list shall be replaced by the new service list.
  - If no services are detected during the automatic search the current service list shall be kept or deleted.
4. Check that the channel list has services configured in the transport stream.
5. Check that the services on the channel list is listed once and not duplicated. Check which channel is received by trying to attenuate the signal level. The services from received channel are frozen when the signal level is too low. [Restore the attenuations to the level before it was changed.](#)
6. Fill in OK or NOK in the measurement record 1 depending if the services were deleted.
7. Fill in OK or NOK in the measurement record 2 depending if the services were installed from expected channel.
8. Repeat the test for the rest of the test points in the measurement record 2.

**Expected result:**

All the test results are OK.

**Test result(s)**

Measurement record 1:

Requirement	Result OK or NOK
The logic of the automatic search function shall be as follows: If any services are detected during the automatic search the current service list shall be replaced by the new service list. If no services are detected during the automatic search the current service list shall be kept or deleted.	
After automatic channel search the	

NorDig

	channel lists do not contain duplicated services.

<b>S2</b>	<b>2</b>	<b>2</b>	<b>S5</b>	<b>5</b>	<b>2</b>
<b>S3</b>	<b>3</b>	<b>3</b>	<b>S6</b>	<b>6</b>	<b>6</b>
<b>S4</b>	<b>4</b>	<b>4</b>			

The TS configuration idea in this test is that on terrestrial network there is possibility to receive several transmitters simultaneously. These transmitters can have partially same content (nationwide services) and partially different content (regionwide services). It is the ON\_id, TS\_id and Service\_id which define a service unique. The Network\_id can be analysed to distinguish the differenciens in the TS. Therefore, it is important that the receiver can in automatic channel search choose the services which have the best reception quality and even find the regionwide services.

Channels x and y shall not be equal.

**Test procedure:**

This test procedure tests combination of the signal level and reception quality.

1. Configure transport streams and setup the instruments. Use DVB-T mode 8k 64QAM R=2/3 Δ/Tu=1/8.
2. Set the signal level of the carrier CH x to a signal level which is about 5dB **higher** than the signal level of the carrier CH y. Both signal levels shall correspond good reception quality (no errors in decoded video).
3. Add noise on carrier CH x to a level that the QMP1 is fulfilled.
4. Perform automatic channel search. The logic of the automatic search function shall be as follows:
  - If any services are detected during the automatic search the current service list shall be replaced by the new service list.
  - If no services are detected during the automatic search the current service list shall be kept or deleted.
5. Check that channel list has services configured in transport streams.

After performing the test the channel list shall be as below:

Position	Service	Channel
1	S1	Y
2	S5/S2 *	Y/X
3	S3	X
4	S4	X
6	S6	Y
7	S2/S5 *	X/Y

\*) Note that order of the services S2 and S5 on the channel list can be chosen by the manufacture. It's highly recommended that the S5 (service without visible errors) is stored in position 2 and the S2 (service with visible errors) is stored in position 7. And generally it is recommended that service detected by the receiver as "better" service is stored in that position which is signalled in Logic Channel No and the other services with same Logic Ch No stored later in the list).

**Expected result:**

All the tests are OK.

**Test result(s)**

Measurement record:

	Requirement	Result OK or NOK
	After automatic channel search the channel lists does not contain duplicated services.	
	The channel list is as defined in test procedure.

<b>S2</b>	<b>2</b>	<b>2</b>	<b>S5</b>	<b>5</b>	<b>2</b>
<b>S3</b>	<b>3</b>	<b>3</b>	<b>S6</b>	<b>6</b>	<b>6</b>
<b>S4</b>	<b>4</b>	<b>4</b>			

The TS configuration idea in this test is that on terrestrial network there is possibility to receive several transmitters simultaneously. These transmitters can have partially same content (nationwide services) and partially different content (regionwide services). It is the ON\_id, TS\_id and Service\_id which define a service unique. The Network\_id can be analysed to distinguish the differences in the TS. Furthermore, regional services may have same LCN which results to a conflict. Finally, it is important that user can force the receiver to search all services within TS by selecting the channel number and install services from that TS on channel list without any quality criteria.

**Test procedure:**

1. Configure transport streams and setup the instruments.
2. Check that channel list is empty. If it is not empty delete all services.
3. Attenuate the carrier on CH x to a signal level that it is not possible to receive.
4. Perform automatic channel search.
5. Check that the services S1, S5 and S6 on channel list are from carrier on CH y by attenuating the carrier on CH y. If the received channel is correct the services S1, S5 and S6 shall be frozen when the signal level is too low. Restore the attenuation level back to same level it was before you started to change it.
6. Decrease the attenuation of the carrier on CH x to a signal level that the carrier is possible to be received. Add noise on carrier CH x to a level that QMP1 is fulfilled.
7. Perform manual channel search. Check that the carrier, which is wanted to be searched, is given in channel number format.
8. Fill in the measurement record.
9. Check that services S1, S2, S3 and S4 on channel list are from carrier on CH x by attenuating the carrier on CH x. If the received channel is correct the services S1, S2, S3 and S4 shall be frozen when the signal level is too low. Restore the attenuation level back to same level it was before you started to change it.
10. Check that service S1 is not listed twice on channel list.

The channel list shall look like this after performing this procedure:

Position	Service	Channel
1	S1	X
2	S2/S5 *	X/Y
3	S3	X
4	S4	X
6	S6	Y
7	S5/S2 *	Y/X

\*) Note that order of the services S2 and S5 can be chosen by the manufacturer. It is highly recommended that the services found in the last manual channel search are stored in the service list according to their signalling.

In terrestrial networks in a case where received services have equal ON\_id, TS\_id and LCN, but Network\_id and Service\_id differ most probably means regional variations of the same service. In that case it is highly recommended to move already stored service to an other position in the channel list and store the service found in the last manual channel search to position signalled in the LCN.

**Expected result:**

All test results shall be OK.

**Test result(s)**

Measurement record:

<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 3:13 Verification of Signal Strength Indicator (SSI)</b>
<b>Section</b>	NorDig Unified 3.4.4.6
<b>Requirement</b>	<p>The NorDig IRD shall be provided with a signal strength indicator (SSI). The value for the SSI shall be referred to the IRD RF signal input.</p> <p>The NorDig IRD shall be able to determine signal strength within a range starting from 15 dB lower than the reference signal level defined in NorDig Specification and up to 35dB above that value or maximum signal input level defined in NorDig Specification.</p> <p>The absolute accuracy shall be <math>\pm 5</math> dB at RF signal input levels -80 dBm to -60 dBm and <math>\pm 7</math> dB for RF signal input levels higher than -60 dBm.</p> <p>The relative accuracy should be <math>\pm 3</math> dB between center frequencies within one frequency band, e.g. VHF Band III or UHF Band IV/V, supported by the receiver.</p> <p>Signal strength indicator shall have a relative numerical value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal strength indicator shall be updated regularly once per second.</p>
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the correct functionality of the signal strength indicator.</p> <p><b>Equipment:</b></p>  <pre> graph LR     TS[TS Source] --&gt; Exciter[DVB-T Exciter]     Exciter --&gt; Receiver[DVB-T receiver]     Receiver --&gt; Monitor[Monitor]     </pre> <p>Gaussian channel profile used i.e. no need for fading simulator.</p> <p>In this test, the signal input level <math>P_{input\ level}</math> at the RF input must be known.</p>

The test procedure assumes that the  $P_{\text{receiver}}$  is not displayed by the receiver. If the  $P_{\text{receiver}}$  is displayed by the receiver this test procedure can be simplified.

**Test procedure:**

Verify SSI values:

1. Set-up the test system
2. Determine the attenuation of the test system so that the signal input level at the receiver input is known in the measured frequencies.
3. Use the following DVB-T mode {8K, 64QAM, R=2/3,  $\Delta/T_U=1/8$ } and signal bandwidth of 8MHz.
4. Set the up-converter to frequency 474MHz (K21).
5. Set the signal level into the receiver according to measurement record 1.
6. Do the channel search.
7. Fill in the SSI value displayed by the receiver in the measurement record 1.
8.  $SSI_{\text{min}}$  and  $SSI_{\text{max}}$  defines the allowed range of the displayed value.
9. Fill in the measurement record 1 OK or NOK depending of the displayed SSI value.
10. Measure rest of the frequencies and DVB-T modes.
11. Fill in the measurement record 1.

Verify the relative error:

1. Convert the displayed SSI values to  $P_{\text{receiver}}$  [dBm] values. Select the correct formula for calculating  $P_{\text{receiver}}$  according to the displayed SSI value as shown below:

$$P_{\text{receiver}} = (3/2) * (SSI - 90) + 20 + P_{\text{reference}} \quad \text{if } 90 \leq SSI < 100$$

$$P_{\text{receiver}} = (1/4) * (SSI - 10) + P_{\text{reference}} \quad \text{if } 10 \leq SSI < 90$$

$$P_{\text{receiver}} = (3/2) * SSI - 15 + P_{\text{reference}} \quad \text{if } 0 \leq SSI < 10$$

2. Fill in the dBm values in the measurement record 2 for corresponding signal input level.
3. Calculate the average value of the  $P_{\text{receiver}}$  values in three frequencies within a frequency band.
4. Verify the calculated  $P_{\text{receiver}}$  [dBm] values are within  $\pm 3$  dB from the average value.
5. Fill in the measurement record 2 OK or NOK

**Expected result:**

All the measurements shall be OK.

The signal strength indicator value is updated regularly once per second.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:14 Verification of Signal Quality Indicator (SQI)</b>
<b>Section</b>	NorDig Unified 3.4.4.7
<b>Requirement</b>	<p>The NorDig IRD shall (1) be provided with a signal quality indicator (SQI). The value for the SQI shall be referred to the IRD RF signal input.</p> <p>The absolute accuracy of the C/N value shall be of ±1dB for C/N values of 17 dB to 27 dB at the IRD RF signal input.</p> <p>The signal quality indicator shall have a relative numerical value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal quality indicator shall be updated regularly once per second.</p>
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the correct functionality of the signal quality indicator.</p> <p><b>Equipment:</b></p>

Gaussian channel profile used i.e. no need for fading simulator.

$C/N_{input}$  refers to generated DVB-T signal  $C/N$  at receiver input.

$C/N_{receiver}$  refers to  $C/N$  determined by the receiver under test.

$$C/N_{rel} = C/N_{input} - C/N_{NorDigP1}$$

$C/N_{NorDigP1}$  refers to table 3.10 at [1].

First we need to define the required  $C/N_{input}$  for the QMP2. After that we know what is the expected rescale of BER before RS. The slope of the curve for BER before RS as a function of the required  $C/N_{input}$  should be equal independently of the receiver. Using that knowledge  $SQI_{min}$  and  $SQI_{max}$  can be calculated.

#### Test procedure:

1. Set up the test instruments
2. Use the following DVB-T mode {8K, 64QAM, R=2/3,  $\Delta/T_U=1/8$ } and signal bandwidth 8MHz.
3. Set the up-converter to frequency 666MHz (K45).
4. Do the channel search.
5. Determine the lowest required  $C/N$  by adjusting the  $C/N_{input}$  until the quality measurement procedure 2 error free video is fulfilled.
6. Fill in the measurement record 1 the  $C/N_{input}$  value defined as  $C/N_{receiver}$ . Later in this test procedure the value  $C/N_{receiver}$  is used for rescaling of the  $BER\_SQI_{min}$  and  $BER\_SQI_{max}$  values.
7. Decrease the  $C/N_{input}$  in 1dB step starting from highest value in measurement record 2.
8. Fill in the displayed SQI in the measurement record 2.
9. Repeat the test for the DVB-T mode {8K, 64QAM, R=3/4,  $\Delta/T_U=1/4$ } and signal bandwidth 8MHz.
10. Do the calculations in the rest of the test procedure.

Calculation for minimum SQI value:

11. Calculate  $C/N_{rel\_error\_min}$  for all  $C/N_{input}$  values using formula  

$$C/N_{rel\_error\_min} = C/N_{rel} - 1$$
12. Calculate  $CNR\_SQI_{min}$  for all  $C/N_{input}$  values using formula  

$$CNR\_SQI_{min} = 0, \quad \text{if } C/N_{rel\_error\_min} < -7 \text{ dB}$$

$$CNR\_SQI_{min} = [(C/N_{rel\_error\_min} - 3)/10] + 1, \quad \text{if } -7 \text{ dB} \leq C/N_{rel\_error\_min} < 3 \text{ dB}$$

$$CNR\_SQI_{min} = 1, \quad \text{if } C/N_{rel\_error\_min} \geq 3 \text{ dB}$$
13. Calculate  $BER\_SQI_{min}$  for all  $C/N_{input}$  values using formula  

$$BER\_SQI_{min} = 19.0 * [C/N_{rel\_error\_min} - (C/N_{receiver} - X) + 3.6],$$

where  $X = 16.2$  (64QAM R2/3)  
 $X = 17.4$  (64QAM R3/4)

if resulted  $BER\_SQI_{min} < 20$  then set  $BER\_SQI_{min} = 0$   
 if resulted  $BER\_SQI_{min} > 100$  then set  $BER\_SQI_{min} = 100$ .

14. Calculate  $SQI_{min}$  using formula  
 $SQI_{min} = CNR\_SQI_{min} * BER\_SQI_{min}$
15. Fill in the  $SQI_{min}$  values in the measurement procedure 2.

Calculation for maximum SQI value:

16. Calculate  $C/N_{rel\_error\_max}$  for all  $C/N_{input}$  values using formula  
 $C/N_{rel\_error\_max} = C/N_{rel} + 1$
17. Calculate  $CNR\_SQI_{max}$  for all  $C/N_{input}$  values using formula  
 $CNR\_SQI_{max} = 0$ , if  $C/N_{rel\_error\_max} < -7$  dB  
 $CNR\_SQI_{max} = [(C/N_{rel\_error\_max} - 3)/10] + 1$ , if  $-7$  dB  $\leq C/N_{rel\_error\_max} < 3$  dB  
 $CNR\_SQI_{max} = 1$ , if  $C/N_{rel\_error\_max} \geq 3$  dB
18. Calculate  $BER\_SQI_{max}$  for all  $C/N_{input}$  values using formula  
 $BER\_SQI_{max} = 19.0 * [C/N_{rel\_error\_max} - (C/N_{receiver} - X) + 3.6]$ ,  
 where  $X = 16.2$  (64QAM R2/3)  
 $X = 17.4$  (64QAM R3/4)  
 if resulted  $BER\_SQI_{max} < 20$  then set  $BER\_SQI_{max} = 0$   
 if resulted  $BER\_SQI_{max} > 100$  then set  $BER\_SQI_{max} = 100$ .
19. Calculate  $SQI_{max}$  using formula  
 $SQI_{max} = CNR\_SQI_{max} * BER\_SQI_{max}$
20. Fill in the  $SQI_{max}$  values in the measurement procedure 2.

**Expected result:**

All the test result are OK.  
 The signal quality indicator is updated regularly once per second.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:15 Changes In Modulation Parameters</b>
<b>Section</b>	NorDig Unified 3.4.5
<b>Requirement</b>	The terrestrial NorDig IRD should recover from changes in modulation parameters at the end of a superframe without a break in the received DVB-T signal and output an error free TS. This should take less than one second for any change. The Nordig IRD should be able to detect a change of modulation parameters signalled in the TPS data of the DVB-T signal, in order to reduce the recovery time.  The terrestrial NorDig IRD should recover from changes in modulation parameters occurring at any time followed by a break in the received DVB-T signal and output an error free TS. This should take less than four seconds for any change.
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<b>Purpose of test:</b> To verify that receiver can recover from changes in modulation parameter occurring at any time followed by a break in the received DVB-T signal and output an error free TS.

**Equipment:**

The DVB-T modulator shall have a bitrate adaptation to test this test, or, alternatively the TS source shall have capability to change the output transport stream bitrate to correspond the DVB-T mode. See bitrates in chapter 2.3.3.

**Test procedure:**

1. Set up the instruments.
2. Use frequency 666 MHz (K45).
3. Set the RF input level to receiver to  $-50\text{dBm}$ .
4. Set up DVB-T mode 8k 64QAM R3/4 G1/4 and signal bandwidth 8 MHz in DVB-T modulator.
5. Verify that the switch is closed.
6. Check picture quality using the quality measurement procedure 1 (QMP1).
7. Open the switch to break the received RF signal
8. Change DVB-T mode to the next mode in the measurement record
9. Wait for the DVB-T modulator output to become valid and stable with this new mode (this time is modulator specific)
10. Close the switch to enable the RF signal to the receiver and record the time taken to achieve QMP1
11. Fill in the measurement record.
12. Repeat steps 7-11 for the rest of the DVB-T modes defined in the measurement record.

**Expected result:**

The receiver can recover from changes in modulation parameter occurring at any time followed by a break in the received DVB-T signal and output an error free TS within 4 seconds (excluding modulator stabilization time) without requiring a channel scan.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:18 Performance: BER vs C/N verification</b>
<b>Section</b>	NorDig Unified 3.4.10.2
<b>Requirement</b>	Verify the internal BER measurement of the NorDig IRD for objective measurements (QMP3).
<b>IRD profile(s)</b>	Basic, IRD, DVB-T

**Test procedure**

**Purpose of test:**

To check that the internal BER value measured by the receiver to reference BER value in a function of C/N on Gaussian channel is correct.

**Equipment:**

Reference BER in a function of the C/N on Gaussian channel.

**Test procedure:**

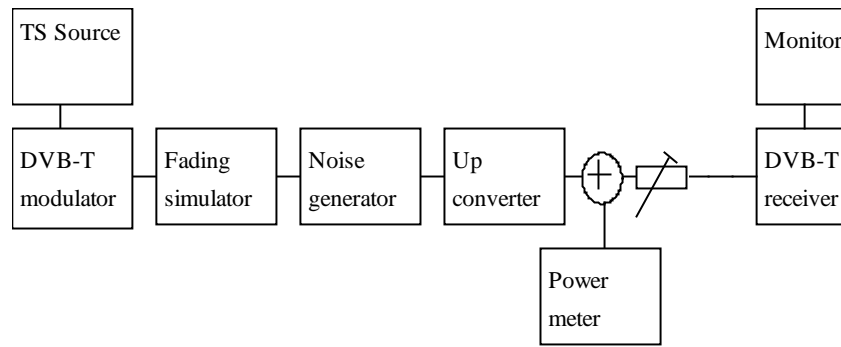

1. Setup the instruments.
2. Use channel 45 and DVB-T mode 8k 64QAM R3/4 G1/4. Set the RF input level to  $-50\text{dBm}$ .
3. Use the quality measurement procedure 2.
4. Compare the BER measured by the receiver to reference BER in a function of the C/N measurement on Gaussian channel.
5. Fill in the BER value in measurement record.
6. Adjust the required C/N that it corresponds BER  $2\text{E-}4$  after viterbi.
7. Decrease the required C/N by 1dB. Check that it corresponds approximately BER  $2\text{E-}3$  after viterbi and QMP1.

**Expected result:**

The measured BER in a function of required C/N shall have the same slope as with the reference BER in a function of required C/N.

	The decrease of the required C/N corresponding BER 2E-4 after Viterbi by 1dB shall result approximately to BER 2E-3 after Viterbi corresponding QMP1.

<i>Test Case</i>	<b>Task 3:19 Performance: C/N performance on Gaussian channel</b>
<i>Section</i>	NorDig Unified 3.4.10.3
<i>Requirement</i>	The NorDig IRD shall have a QEF performance for the C/N ratios given in Table 3.9, or better performance.
<i>IRD profile(s)</i>	Basic, IRD, DVB-T
<i>Test procedure</i>	<b>Purpose of test:</b> To test the required C/N for quasi error free reception in Gaussian channel.  <b>Equipment:</b>

**Test procedure for Gaussian channel:**

16. Set up the test instruments
17. Use the following mode {8K, 64QAM, R=2/3,  $\Delta/T_U=1/8$ }
18. Set the up-converter to channel 21
19. Measure the input level to the attenuator.
20. Determine the attenuation of the attenuator and the cables.
21. Calculate the receiver input signal level and set it to  $-50\text{dBm}$ .
22. Use the value for the required C/N specified for the DVB-T mode in table 3.9.
23. Do the channel search.
24. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) fulfils.
25. Fill in the measured value in dB in the measurement record.
26. Repeat the test for the rest of the frequencies, signal bandwidths and DVB-T modes defined in the measurement record.

**Expected result:**

The required C/N for quasi error free reception in gaussian channel is less than specified in table 3.9.

<b>Test Case</b>	<b>Task 3:21 Performance: Minimum receiver signal input levels on Gaussian channel</b>
<b>Section</b>	NorDig Unified 3.4.10.4
<b>Requirement</b>	The NorDig IRD shall have at least the performance for the signal input levels for the supported frequency range and should have a performance which is one dB better than specified in Table 3.13
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<b>Purpose of test:</b> To verify the sensitivity of the receiver on Gaussian channel over the supported frequency range.

**Equipment:**

Be careful in impedance matching of cables, adapters and etc.

**Test procedure for the sensitivity on the gaussian channel:**

1. Set up the test instruments
2. Use the following DVB-T mode {8K, 64QAM, R=2/3,  $\Delta/T_U=1/8$ } and signal bandwidth 8MHz.
3. Set the up-converter to frequency 474MHz (K21).
4. Measure the input level to the attenuator.
5. Determine the attenuation of the attenuator and the cables.
6. Calculate the receiver input signal.
7. Do the channel search.
8. Increase the received input level from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
9. Fill in the measured value in the measurement record.
10. Repeat the test for the rest of the frequencies, DVB-T modes and signal bandwidths on measurement record.

**Expected result:**

Sensitivity shall be equal or better for all measured frequencies (channels) and for all DVB-T modes and signal bandwidths as specified in Table 3.13.

<b>Test Case</b>	<b>Task 3:25 Performance: Immunity to “digital” signals in Other Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.7.1
<b>Requirement</b>	<p>The NorDig IRD shall, for the supported frequency ranges, permit an interfering DVB-T signal with a minimum interference to signal level ratio (I/C) as stated in table 3.16 while maintaining QEF reception.</p> <p>The requirements in this paragraph refer to the modes {8K, 64-QAM, R=2/3, Δ/Tu =1/8} and {8K, 64-QAM, R=2/3, Δ/Tu =1/4} and {8K, 64-QAM, R=3/4, Δ/Tu =1/4}</p>
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the QEF reception when there is interference from DVB-T signal on adjacent or other channels.</p> <p><b>Equipment:</b></p>  <p>Verify that the digital TV signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Set up the test instruments</li> <li>2. Use the following DVB-T mode {8K, 64-QAM, R=2/3, Δ/T<sub>U</sub>=1/8} and signal bandwidth 8MHz.</li> <li>3. Set the channel A up-converter to 666.0MHz (K45).</li> <li>4. Set the channel B up-converter to 674.0MHz (K46).</li> <li>5. Set the receiver input level for the DVB-T signal in channel B to -30 dBm.</li> <li>6. Decrease the DVB-T signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.</li> <li>7. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.</li> <li>8. Repeat the test when the channel B up-converter is set to frequencies 658.0 MHz (K44), 650.0 MHz (K43), 682.0 MHz (K47).</li> <li>9. Repeat the test according to procedure above for the image channel<sup>1)</sup>. Set the receiver input level for the DVB-T signal in channel B to -30dBm.</li> <li>10. Repeat the test for the DVB-T modes {8K, 64-QAM, R=2/3, Δ/T<sub>U</sub>=1/4} and</li> </ol>

- {8K, 64-QAM, R=3/4,  $\Delta/T_U=1/4$ } using signal bandwidth 8MHz,
11. Change the signal bandwidth to 7MHz.
  12. Set the channel A up-converter to frequency 198.5 MHz (K8).
  13. Set the channel B up-converter to frequency 205.5 MHz (K9).
  14. Set the receiver input level of the DVB-T signal in channel B to -30dBm.
  15. Decrease the DVB-T signal level in channel A to a signal level when the quality measurement procedure 2 is fulfilled.
  16. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
  17. Repeat the test when the channel B up-converter is set to frequencies 191.5 MHz (K7), 184.5 MHz (K6) and 212.5 MHz (K10).
  18. Repeat the test for the DVB-T modes {8K, 64-QAM, R=2/3,  $\Delta/T_U=1/4$ } and {8K, 64-QAM, R=3/4,  $\Delta/T_U=1/4$ } using signal bandwidth 7MHz,

<sup>1)</sup> Example: if intermediate frequency IF is 36.15MHz, the image channel is calculated for channel 45 as  $666\text{MHz} + 2 * 36.15\text{MHz} = 738.3\text{MHz}$  which is close to channel 54.

**Expected result:**

The protection ratios shall be fulfilled for received signal at the requested quality level for specified DVB-T modes, signal bandwidths and supported frequencies.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:26 Performance: Immunity to “LTE 700 MHz” signals in Other Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.7.2
<b>Requirement</b>	The terrestrial NorDig IRD and IRD-T2 shall, for the supported frequency ranges, permit an interfering 4G (LTE) “700MHz” signal with a minimum interference to signal level ratio (I/C) as stated in the Table 3.xx (1) while maintaining QEF reception.  The power of the interfering LTE signal, both BS and UE, varies with a traffic load and traffic type. The signal power of the LTE signal is defined as the power during the active part of the time varying LTE signal, referred to as the licensed power level (I).

	<p>The I/C values shall (1) be fulfilled for LTE signals with traffic loads from 0% to 100 % (BS) and for traffic loads from low bit rate to high bit rate (UE). Low traffic loads can be the most demanding ones. The minimum I/C requirement shall be fulfilled for -25 dBm in case of UE signals and -15dBm in case of BS signals defined as licensed power of interfering signal, at the input of the IRD.</p> <p>The requirements in this paragraph refer, for DVB-T, to following modes {FFT size, modulation, code rate, guard interval, bandwidth}; {8K, 64-QAM, R=2/3, <math>\Delta/T_u = 1/8</math>, 8MHz} and {8K, 64-QAM, R=2/3, <math>\Delta/T_u = 1/4</math>, 8MHz} and {8K, 64-QAM, R=3/4, <math>\Delta/T_u = 1/4</math>, 8MHz} and and for DVB-T2 to the modes {FFT size, modulation, pilot pattern, code rate, guard interval, bandwidth} {32KE, 256-QAM R, PP4, R=2/3, <math>\Delta/T_u = 1/16</math>, 8MHz} {32KE, 256-QAM R, PP4, R=3/5, <math>\Delta/T_u = 19/256</math>, 8MHz} {32KN, 256-QAM R, PP4, R=2/3, <math>\Delta/T_u = 19/256</math>, 7MHz} and</p>

<b>Test Case</b>	<b>Task 3:29 Performance: Synchronisation for varying echo power levels in SFN</b>
<b>Section</b>	NorDig Unified 3.4.10.10
<b>Requirement</b>	For the modes {8K, 64-QAM, R=2/3, $\Delta/T_U=1/8$ }, {8K, 64-QAM, R=2/3, $\Delta/T_U=1/4$ } and {8K, 64-QAM, R=3/4, $\Delta/T_U=1/4$ }, the required C/N value for subjective error free reception shall be obtained when the channel contains two paths with relative delay from 1.95 $\mu$ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing.
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<b>Purpose of test:</b> To verify the SFN synchronisation when the amplitude of the echo compared to the amplitude of the direct signal varies in a function of time.  <b>Equipment:</b>

The 0 degree channel center shall be used in fading simulator (see2.3.5).

**Test procedure for variations of the echo attenuation in a function of time:**

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following mode {8K, 64-QAM, R=3/4,  $\Delta/T_U=1/4$ }.
3. Open the switch.
4. Configure the first path signal (direct) with following parameters: 0dB attenuation and 0 $\mu$ s delay.
5. Configure the second path signal (1<sup>st</sup> echo) with following parameters: 0dB attenuation and first delay value from the measurement record. .
6. Set the receiver input level to -50 dBm.
7. Configure the third path signal (2nd echo) with following parameters: 1dB attenuation and delay same as for the second path and 0.1Hz frequency separation.
8. Close the switch.
9. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the measured required C/N value in dB in the measurement record.
11. Repeat the test for the rest of the echo delay values in the measurement record following the procedure above. Between change of the echo delay, RF input signal to the receiver shall be disconnect.
12. Repeat the test for the DVB-T modes {8K, 64-QAM, R=2/3,  $\Delta/T_U=1/8$ } and {8K, 64-QAM, R=2/3,  $\Delta/T_U=1/4$ }.

**Expected result:**

The IRD shall maintain the SFN synchronisation when the amplitude of the echo signal varies in a function of time. The required C/N shall not exceed the specified value in table 3.18.

**Test result(s)**

Measurement record:

F = 666.0 MHz (K45) and signal bandwidth 8 MHz.							
Mode	10 $\mu$ s	56 $\mu$ s	105 $\mu$ s	112.1 $\mu$ s	130 $\mu$ s	170 $\mu$ s	212 $\mu$ s
8k 64QAM R2/3 G1/8							
8k 64QAM R3/4 G1/4							
8k 64QAM R2/3 G1/4							

**Conformity**

<i>Test Case</i>	<b>Task 3:30 Performance: C/(N+I) Performance in SFN for more than one echo</b>
<i>Section</i>	NorDig Unified 3.4.10.11
<i>Requirement</i>	<p>If there exists one or more FFT window positions for the time synchronisation that will give an aggregate available C/(N+I) larger than or equal to the required EPT (Effective Protection Target), the NorDig IRD shall be able to find one of these positions, independently of echo profile. The NorDig IRD shall also be able to correctly equalise the signal for echoes up to <math>7T_U/24</math> (260 <math>\mu</math>s) (Interval of correct equalisation), independently of the echo profile.</p> <p><sup>1)</sup> EPT = Effective Protection Target</p>
<i>IRD profile(s)</i>	Basic, IRD, DVB-T
<i>Test procedure</i>	<p><b>Purpose of test:</b></p> <p>To verify the SFN synchronization of the receiver when two echo signals are present.</p> <p><b>Equipment:</b></p>  <p>The 0 degree at channel center shall be used in fading simulator (see 2.3.5).</p> <p><b>Test procedure:</b></p> <p>Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.</p> <ol style="list-style-type: none"> <li>1. Set up the test instruments.</li> <li>2. Use the following DVB-T mode {8K, 64-QAM, R=3/4, <math>\Delta/T_U=1/4</math>} and signal bandwidth 8MHz.</li> <li>3. Open the switch.</li> <li>4. Configure one path of the channel simulator to have a 0dB attenuation, 0<math>\mu</math>s delay and 0 degree phase.</li> <li>5. Configure the second path of the channel simulator to have relative delay difference -100.1<math>\mu</math>s and attenuation 21dB (pre echo) and 0 degree phase.</li> <li>6. Configure the third path of the channel simulator to have relative delay difference +100.0<math>\mu</math>s and attenuation 15 dB (post echo) and 0 degree phase.</li> <li>7. Set the receiver input level to -50 dBm.</li> <li>8. Close the switch.</li> <li>9. Increase the required C/N value from low value to higher value until the quality</li> </ol>

- measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the required C/N value in dB in the measurement record.
  11. Measure the rest of the required C/N values starting at the bottom of the table and upward.
  12. Fill in the results in the measurement record. During the change of the delay and the attenuation, the input RF signal to receiver shall be disconnected.
  13. Repeat the test for the DVB-T mode {8K, 64-QAM, R=2/3,  $\Delta/T_U = 1/8$ }.
  14. Repeat the test for the DVB-T mode {8K, 64-QAM, R=2/3,  $\Delta/T_U = 1/4$ }.

**Expected result:**

The IRD shall synchronize in all combinations defined in measurement record and the required C/N value shall not exceed the required C/N defined for profile 2: 0dB echo in table 3.9.

<b>Test Case</b>	<b>Task 3:32 Performance: C/(N+I) Performance in SFN outside the guard interval</b>
<b>Section</b>	NorDig Unified 3.4.10.11
<b>Requirement</b>	For echoes outside the guard interval, for 8MHz DVB-T signal, QEF reception shall be possible with echo levels up the values defined in Table 3.22  For echoes outside the guard interval, for 7MHz DVB-T signal, QEF reception shall be possible with echo levels up the values defined in Table 3.23.
<b>IRD profile(s)</b>	Basic, IRD, DVB-T
<b>Test procedure</b>	<b>Purpose of test:</b> To verify the SFN synchronisation in SFN for echoes outside guard interval.  <b>Equipment:</b>

**Test procedure for evaluation of synchronization for echoes outside the guard interval:**

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following mode {8K, 64-QAM, R=3/4,  $\Delta/T_U=1/4$ } and signal bandwidth 8MHz.
3. Open the switch.
4. Set the receiver input level to -50 dBm for the wanted signal.
5. Set the channel simulator relative delay difference to 230us for the echo signal.
6. Close the switch.
7. Increase the echo attenuation from low value to higher value until quality measurement procedure 2 (QMP2) is fulfilled.
8. Fill in echo attenuation result in dB in the measurement record.
9. Repeat the test the rest of the combinations of the relative delays and attenuation levels defined in measurement record.. Open the switch before changing the delay and attenuation level.
10. Repeat the test for the DVB-T modes {8K, 64-QAM, R=2/3,  $\Delta/T_U=1/8$ } and {8K, 64-QAM, R=2/3,  $\Delta/T_U=1/4$ }.
11. Set the up-converter to center frequency 198.5MHz (K8).
12. Follow the test procedure and repeat the test for the 7 MHz signal bandwidth and DVB-T modes defined in the measurement record according to procedure above.

**Expected result:**

All the echo attenuation values shall be equal or lower compared to NorDig Unified values in tables 3.20 and 3.21.

*Test result(s)*

<b>Test Case</b>	<b>Task 3:33 DVB-T2: Frequencies: Center frequencies</b>					
<b>Section</b>	NorDig Unified 3.4.2.2					
<b>Requirement</b>	<p>The front-end shall for the supported frequency ranges be capable of tuning to the center frequency <math>f_c</math> of the incoming DVB-T/T2 RF signal, see below and NorDig Specification :</p> <p><u>8 MHz raster:</u>  <math>f_c = 114 \text{ MHz} + K * 8 \text{ MHz}</math>, where K is an integer number, running from 0 to 93.</p> <p><u>7 MHz raster:</u>  <math>f_c = 107.5 \text{ MHz} + L * 7 \text{ MHz}</math>, where L is an integer number, running from 0 to 27.</p> <p><u>1,7 MHz raster (DVB-T2):</u>  <math>f_c</math> shall be as specified in Annex B2.</p>					
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2					
<b>Test procedure</b>	<p><b>Purpose of test:</b>            To verify the reception over the supported frequency range.</p> <p><b>Equipment:</b></p> <div style="text-align: center;"> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="width: 100px; text-align: center;">TS source</td> <td style="width: 20px; text-align: center;">—</td> <td style="width: 100px; text-align: center;">DVB-T2 exciter</td> <td style="width: 20px; text-align: center;">—</td> <td style="width: 100px; text-align: center;">DVB-T2 receiver</td> </tr> </table> </div> <p>Use following DVB-T2 modes:</p> <ul style="list-style-type: none"> <li>VHF III 1.7 MHz signal bandwidth: 8k normal bandwidth, 64QAM rotated, G1/8, PP2, R3/4, L1-ACE &amp; TR PAPR</li> </ul>	TS source	—	DVB-T2 exciter	—	DVB-T2 receiver
TS source	—	DVB-T2 exciter	—	DVB-T2 receiver		

- VHF III 7 MHz signal bandwidth: 32k normal bandwidth, 256QAM rotated, GI1/8, PP2, R3/4, L1-ACE & TR PAPR
- VHF S I and S II, III and UHF S III 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE & TR PAPR
- UHF IV/V 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE & TR PAPR

**Test procedure:**

1. Set up the test instruments
2. Use the corresponding DVB-T2 mode from list above.
3. Use input level of -50 dBm
4. Start with frequency 177.5 MHz (K5)
5. Use the quality measurement procedures 1 (QMP1)
6. Fill the result in the measurement record: **OK** or **NOK**.
7. Repeat the test for all channels in the table 1 and table 2 in the measurement record.
8. If the receiver supports optional frequency ranges, test all remaining channels in table 3 and 4 in the measurement record.

**Expected result:**

The result of the test shall be OK for all channels in table 1 in test results.

<i>Test Case</i>	<b>Task 3:35 DVB-T2: Frequencies: Signal bandwidths</b>
<i>Section</i>	NorDig Unified 3.4.2.4
<i>Requirement</i>	<p>The NorDig IRD for DVB-T2 shall support both the normal and extended carrier modes.</p> <p>The NorDig IRD for DVB-T2 shall follow network parameter change from normal to extended carrier mode and vice versa automatically without any need for user action.</p>

	<p>VHF Bands: The NorDig IRD shall (1) for the supported frequency ranges be able to receive 7 MHz and should be able to receive 8 MHz DVB-T/T2 signals. If 8 MHz bandwidth is supported it shall automatically detect which DVB-T/T2 signal bandwidth is being used, and it shall be possible to receive the 8 MHz DVB-T/T2 signals on the 7 MHz channel frequency raster. If 1.7 MHz bandwidth is supported the NorDig IRD-T2 shall automatically detect which DVB-T/T2 signal bandwidth is being used.</p> <p>UHF Bands: The NorDig IRD shall for the supported frequency ranges be able to receive 8 MHz DVB-T/T2 signals.</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the receiver is able to automatically detect the transmitted signal bandwidth and do the required adaptations for QEF reception.</p> <p><b>Equipment:</b></p> <div data-bbox="405 907 1029 996" style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <pre> graph LR     A[TS source] --- B[DVB-T2 exciter] --- C[DVB-T2 receiver]             </pre> </div> <p>Use following DVB-T2 modes in single PLP mode:</p> <ul style="list-style-type: none"> <li>• VHF III 1.7 MHz signal bandwidth: 8k normal bandwidth, 64QAM rotated, G1/8, PP2, R2/3, L1-ACE &amp; TR PAPR</li> <li>• VHF III 7 MHz signal bandwidth: 32k normal or extended bandwidth, 256QAM rotated, GI19/256, PP2, R2/3, L1-ACE &amp; TR PAPR</li> <li>• VHF III 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, GI19/256, PP2, R3/5, L1-ACE &amp; TR PAPR</li> <li>• UHF IV/V 8 MHz signal bandwidth: 32k normal or extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE &amp; TR PAPR</li> </ul> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Set up the test instruments.</li> <li>2. Use the transmission frequency UHF IV/V 666 MHz (K45) and an input level of -50 dBm to the receiver. Select corresponding DVB-T2 mode from list above.</li> <li>3. Connect the receiver and perform an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.</li> <li>4. Use the quality measurement procedure 1 (QMP1).</li> <li>5. Fill the result in the measurement record: <b>OK</b> or <b>NOK</b>.</li> <li>6. Change the transmission frequency to VHF III channel 198.5 MHz (K8) and signal bandwidth to 7 MHz. Select corresponding DVB-T2 mode from list above.</li> <li>7. Verify that the channel list does not have any services installed by performing initialization to factory defaults or in such way.</li> <li>8. Do an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.</li> <li>9. Use the quality measurement procedure 1 (QMP1).</li> <li>10. Fill the result in the measurement record: <b>OK</b> or <b>NOK</b>.</li> <li>11. If receiver supports 1.7MHz signal bandwidth in VHF III, change the transmission frequency to VHF III channel 209.936 MHz (10A) and signal bandwidth to 1.7 MHz. Select corresponding DVB-T2 mode from list above.</li> </ol>

12. Verify that the channel list does not have any services installed by performing initialization to factory defaults or in such way.
13. Do an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.
14. Use the quality measurement procedure 1 (QMP1).
15. If receiver supports 8MHz signal bandwidth in VHF III, change the transmission frequency to VHF III channel 198.5 MHz (K8) and signal bandwidth to 8 MHz. Select corresponding DVB-T2 mode from list above.

**Expected result:**

The test results shall be OK for all tests in the table 1 and table 2 in the measurement record and user does not have to initialize the signal bandwidth for the successful channel search and QEF reception.

If 1.7MHz signal bandwidth in VHF is supported the test result shall be OK for the test in the table 3 in the test results.

If 8MHz signal bandwidth in VHF is supported the test result shall be OK for the test in the table 3 in the test results.

Fill in <b>NOK</b> or <b>OK</b> in measurement record.</li> <li>10. Increase the attenuation for the channel A so that it is not any more able to be received.</li> <li>11. Decrease the attenuation for the channel B. Adjust the receiver input level to -50dBm.</li> </ol>	SISO/MISO	MISO
SISO/MISO	MISO		

12. Verify the service carried on channel Bis able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
13. Fill in **NOK** or **OK** in measurement record.

Secondly verify reception in SFN like channels in MISO modes with different group settings.

14. Set the DVB-T2 exciter in channel A to MISO group 1 mode with parameters 8 MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR,  $L_r=62$ .
15. Set relative delay of the exciters to 10 $\mu$ s, adjust output levels to 0dB echo difference and verify the total output power level is -50dBm as well as noise power to a level corresponding 30dB signal-to-noise ratio.
16. Verify the service carried on channel A is able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
17. Fill in **NOK** or **OK** in measurement record.
18. Set the relativedelay of the exciters to 170 $\mu$ s and output power level difference to 0dB.
19. Verify the service carried on channel A is able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
20. Fill in **NOK** or **OK** in measurement record.

Thirdly verify reception in SFN like channels in MISO modes with equal group settings.

21. Set the DVB-T2 exciters in channel A and B to MISO group 2 <sup>1)</sup> mode with parameters 8 MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR,  $L_r=62$ .
22. Set relative delay of the exciters to 10 $\mu$ s, adjust output levels to 0dB echo difference and verify the total output power level is -50dBm as well as noise power to a level corresponding 30dB signal-to-noise ratio.
23. Verify the service carried on is able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
24. Fill in **NOK** or **OK** in measurement record.
25. Set the relative delay of the exciters to 170 $\mu$ s and output power level difference to 0dB.
26. Verify the service carried on is able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
27. Fill in **NOK** or **OK** in measurement record.

<sup>1)</sup>Consider reception in SFN consisting three or more transmitters. Because of group settings in exciters, reception from exciters within same group or different groups may occur.

**Expected result:**

The IRD is able to decode services correctly and all the test results are OK.

**Test result(s)**

Measurement record

Exciter 1	Exciter 2	Channel profile	NOK or OK
MISO group 1	-	Gaussian	
-	MISO group 2	Gaussian	
MISO group 1	MISO group 2	10 $\mu$ s 0dB echo	
MISO group 1	MISO group 2	170 $\mu$ s 0dB echo

<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that received DVB-T2 signal can stress the receiver RBM regarding de-jitter</p>

buffer based on DVB V&V tests.

**Equipment:**

Use Mode B (multiple PLP) and parameter settings defined in 2.3.7 Summary of DVB-T2 modes for NU\_M3.

T2 frames within  $PLP_{id}=0$  and 2 shall carry a valid TS. TS bit rate is restricted to maximum of 3.3 MBit/s.

The content within TS is maximized to bit rate the TS can carry, with other words, minimize the NULL packets in TS.

TS contains one service.

The DVB-T2 signal generation shall support DVB V&V dynamic multiple PLP models. The configuration files are available for download on NorDig homepages.

Parameter	Description	Value
M	Interval in packets between common PLP slots	11
L	Number of separate chapters	8
NumReps	Repeats of repeating unit	15, 1, 15, 1, 15, 1, 15, 1, 15, 1
RunLength (TS0)	Run length for TS0 in each repeating unit in a chapter	102, 95, 102, 95, 102, 95, 102, 95
RunLength (TS1)	Run length for TS1 in each repeating unit in a chapter	15, 29, 15, 29, 15, 29, 15, 29
RunLength (TS2)	Run length for TS2 in each repeating unit in a chapter	14, 15, 14, 15, 14, 15, 14, 15
RunLength (TS3)	Run length for TS3 in each repeating unit in a chapter	14, 16, 14, 16, 14, 16, 14, 16

**Test procedure:**

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP7,  $\Delta/T_U=1/128$ } and signal bandwidth 8MHz in exciter.
3. Use Gaussian channel without additional noise or interference.
4. Set the receiver input level to -50 dBm.
5. Verify valid TS is mapped into the  $PLP_{id}=0$ .
6. Perform channel search and make sure the receiver has deleted any possible old service on the channel list.
7. Verify the received signal carrying service using quality measurement procedure 2

	(QMP2). 8. Repeat the test for TS mapped into the $PLP_{id=2}$ .  <b>Expected result:</b>  Broadcasting of DVB-T2 signal according to signal description which stresses the RBM is demodulated correctly and service carried within TS is decoded error free.

<i>Test Case</i>	<b>Task 3:45 DVB-T2: Input Mode A (RBM when FEF present)</b>
<i>Section</i>	NorDig Unified 3.4.3
<i>Requirement</i>	<p>Within the NorDig IRD specification the concept of "DVB-T2 mode" includes e.g. (the list is not exhaustive):</p> <ul style="list-style-type: none"> <li>• Input Mode A (single PLP) or Input Mode B (Multiple PLPs – Common PLP, Type 1 and 2 up to the maximum allowed figure 255)</li> </ul> <p>DVB-T2 signal introduces a receiver buffer model (RBM) which is fundamental when it comes to receive signals where carried transport stream doesn't have constant bit rate as it is case when FEF is present.</p>
<i>IRD Profile(s)</i>	Basic, IRD, DVB-T2
<i>Test procedure</i>	<p><b>Purpose of test:</b> To verify that received DVB-T2 signal can stress the receiver RBM based on DVB V&amp;V tests.</p> <p><b>Equipment:</b></p>

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes for NU\_S34:

PLP Code rate	3/5
PAPR	TR & L1-ACE
PAPR $V_{clip}$	3.55V
L1_ ACE_MAX	0.1
ISSY	Enabled
FEF	Yes
Auxiliary streams	Not used
Frames per superframe ( $N_{T2}$ )	6
FEF P1: S1 Value	2
FEF P1: S2 Value	1
T2 P1:S2 Value	1
FEF size	595420 samples
Design delay	719388 samples
BUFS	2097152

The DVB-T2 signal shall contain a FEF with PRBS content and with a FEF interval of 6 T2 frames.

The size of the PRBS FEF is 595420 samples and T2 frame size  $L_f=62$  symbols.

T2 frames shall carry a TS. TS bitrate is restricted to maximum of 4.5MBit/s.

The content of the TS is maximed to TS bit rate.

TS contains at least one service.

The configuration files are available for download on NorDig homepages.

Using DVB-T2 mode specified ( $L_f=62$  symbols) below allows total bit rate of 32.849069 Mbit/s. Using FEF and T2 frame size relation above, the TS bit rate is 31.406587 Mbit/s.

#### Test procedure:

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP4,  $R=3/5$ ,  $\Delta/T_U=1/16$ } and signal bandwidth 8MHz in exciter according to description above of the DVB-T2 signal.
3. Use Gaussian channel without additional noise or interference.
4. Set the receiver input level to -50 dBm.

	<p>5. Perform channel search and make sure the receiver has deleted any possible old service on the channel list.</p> <p>6. Verify the received signal carrying services using quality measurement procedure 2 (QMP2).</p> <p><b>Expected result:</b></p> <p>Broadcasting of DVB-T2 signal according to signal description which stresses the RBM is demodulated correctly and services carried within TS are decoded correctly.</p>

<p><b>Test Case</b></p>	<p><b>Task 3:48 DVB-T2: Tuning/Scanning Procedures: Automatic channel search for the same service bouquet</b></p>									
<p><b>Section</b></p>	<p>NorDig Unified 3.4.4.4</p>									
<p><b>Requirement</b></p>	<p>The IRD shall provide an automatic search that finds all of the multiplexes and services in the whole (supported) frequency range, see NorDig specification. The logic of the automatic search function shall be as follows: If any services are detected during the automatic search the current service list shall be replaced by the new service list.</p>									

If no services are detected during the automatic search the current service list shall be kept or deleted.

The IRD shall only display a service once in the service list (i.e. avoiding duplicate of the same services), even if the same service (same triplet original\_network\_id, transport\_stream\_id and service\_id) is received from multiple transmitters. If the same service can be received from several transmitters, the one with best reception quality shall be selected. The criteria for selection of the best received service (i.e. best reception quality) shall be based on the combination of the signal strength and signal quality according to NorDig specification.

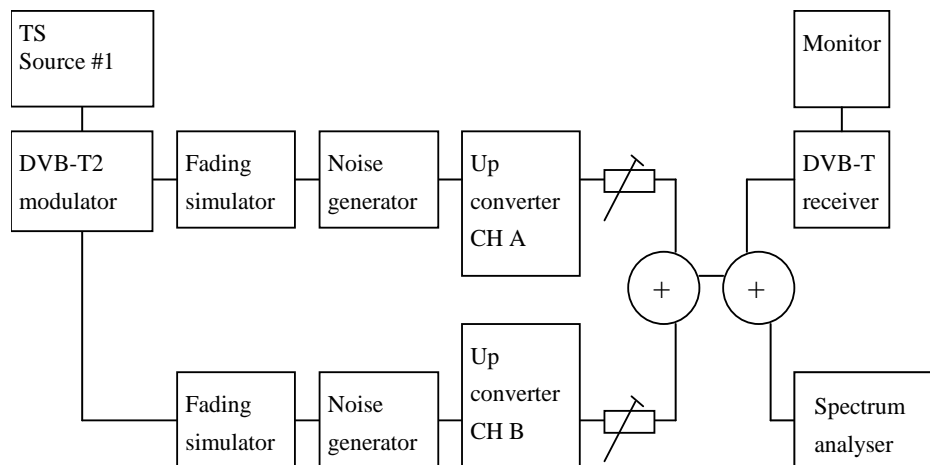

**IRD profile(s)** Basic, IRD, DVB-T2

**Test procedure**

**Purpose of test:**

To verify the best service selection in automatic channel search when the content of the transport stream is the same on several transmitters.

**Equipment:**

**Channels A and B**

**TS source #1**

**ONID=8945**

**Network ID=1000**

**Network Name=Net1**

**TSID=100**

**Services**

Name	SID	Logic Ch No
S1	1	1
S2	2	2
S3	3	3
S4	4	4

**S1 1 1**

**S2 2 2**

**S3 3 3**

**S4 4 4**

There is a possibility to receive broadcasts from several transmitters simultaneously in DVB-T2 networks. These transmitters can have exactly the same content, but are transmitted on different channels (frequencies). Therefore, it is important that the receiver can choose by an automatic channel search the services with the best reception quality.

Test to verify broadcast where equal services are broadcasted simultaneously over DVB-T and DVB-T2 networks is not required.

	<p>Reception quality can be divided into two different parameters:</p> <ul style="list-style-type: none"> <li>• Signal strength</li> <li>• Signal quality</li> </ul> <p>Signal quality can be divided into two main parameters:</p> <ul style="list-style-type: none"> <li>• Signal-to-noise ratio (C/N)</li> <li>• Bit error rate before BCH (BER before BCH in DVB-T2 system)</li> </ul> <p>Channels A and B shall not be equal.</p> <p>Relative signal levels can be observed on spectrum analyser.</p> <p><math>\Delta S</math> refers to difference in SSI according to [1] Annex D.</p> <p><math>\Delta Q</math> refers to difference in SQI according to [1] Annex D.</p> <p>AWGN refers to Additive White Gaussian Noise.</p> <p>As a pre-requisite to perform this test, IRD shall correctly pass the following tasks:</p> <ul style="list-style-type: none"> <li>• Task 3:51 Verification of Signal Strength Indicator (SSI)</li> <li>• Task 3:52 Verification of Signal Quality Indicator (SQI)</li> </ul> <p>Measurement record2 shows the minimum tests that shall be performed. Signal levels and signal quality (i.e added AWGN) can be adjusted from the initial values shown to ensure the required <math>\Delta S</math> and <math>\Delta Q</math> conditions are met.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Configure the transport stream and setup the instruments. Use the DVB-T2 mode 32k extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE &amp; TR PAPR.</li> <li>2. Set the signal level of the both carriers CH A and CH B to the same level. The signal level shall correspond good reception quality (no errors in decoded video).</li> <li>3. Perform automatic channel search. The logic of the automatic search function shall be as follows: <ul style="list-style-type: none"> <li>If any services are detected during the automatic search the current service list shall be replaced by the new service list.</li> <li>If no services are detected during the automatic search the current service list shall be kept or deleted.</li> </ul> </li> <li>4. Check that the channel list has services configured in the transport stream.</li> <li>5. Check that the services on the channel list is listed once and not duplicated. Check which channel is received by trying to attenuate the signal level. The services from received channel are frozen when the signal level is too low. Restore the attenuations to a level before it was changed.</li> <li>6. Fill in OK or NOK in the measurement record depending if the services were deleted.</li> <li>7. Fill in OK or NOK in the measurement record 2 depending if the services were installed from expected channel.</li> </ol> <p>Repeat the test for the rest of the test points in the measurement record 2.</p> <p><b>Expected result:</b> All the test results are OK.</p>

The value for the SSI shall be referred to the IRD RF signal input.</p> <p>The NorDig IRD shall be able to determine signal strength within a range starting from 15 dB lower than the reference signal level defined in (1) and up to 35dB above that value or maximum signal input level defined in section (1)</p> <p>The absolute accuracy shall be <math>\pm 5</math> dB at RF signal input levels -80 dBm to -60 dBm and <math>\pm 7</math> dB for RF signal input levels higher than -60 dBm.</p> <p>The relative accuracy should be <math>\pm 3</math> dB between center frequencies within one frequency band, e.g. VHF Band III or UHF Band IV/V, supported by the receiver.</p> <p>Signal strength indicator shall have a relative value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal strength indicator shall be updated regularly once per second.</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the correct functionality of the signal strength indicator.</p> <p><b>Equipment:</b></p>  <pre> graph LR     TS[TS Source] --&gt; Exc[DVB-T2 Exciter]     Exc --&gt; Rec[DVB-T2 receiver]     Rec -.-&gt; Mon[Monitor]     </pre> <p>Gaussian channel profile used i.e. no need for fading simulator.</p> <p>In this test, the signal input level <math>P_{input\ level}</math> at the RF input must be known.</p> <p>The test procedure assumes that the <math>P_{receiver}</math> is not displayed by the receiver. If the <math>P_{receiver}</math> is displayed by the receiver this test procedure can be simplified.</p> <p><b>Test procedure:</b></p> <p>Verify the SSI value:</p> <ol style="list-style-type: none"> <li>1. Set-up the test system</li> <li>2. Determine the attenuation of the test system so that the signal input level at the receiver input is known in the measured frequencies.</li> <li>3. Use the following DVB-T2 mode {32K extended, 256QAM, PP4, <math>R=2/3, \Delta/T_0=1/16</math>} and signal bandwidth of 8MHz.</li> <li>4. Set the up-converter to frequency 474MHz (K21).</li> <li>5. Set the signal level into the receiver according to measurement record 1.</li> <li>6. Do the channel search.</li> <li>7. Fill in the SSI value displayed by the receiver in the measurement record 1.</li> <li>8. <math>SSI_{min}</math> and <math>SSI_{max}</math> defines the allowed range of the displayed value.</li> <li>9. Fill in the measurement record 1 OK or NOK depending of the displayed SSI value.</li> </ol>

10. Measure rest of the frequencies and DVB-T2 modes.
11. Fill in the measurement record 1.

Verify the relative error:

1. Convert the displayed SSI values to  $P_{\text{receiver}}$  [dBm]. Select the correct formula for calculating  $P_{\text{receiver}}$  according to the displayed SSI value as shown below:

$$\begin{aligned}
 P_{\text{receiver}} &= (3/2) * (\text{SSI} - 90) + 20 + P_{\text{reference}} && \text{if } 90 \leq \text{SSI} < 100 \\
 P_{\text{receiver}} &= (1/4) * (\text{SSI} - 10) + P_{\text{reference}} && \text{if } 10 \leq \text{SSI} < 90 \\
 P_{\text{receiver}} &= (3/2) * \text{SSI} - 15 + P_{\text{reference}} && \text{if } 0 \leq \text{SSI} < 10
 \end{aligned}$$

2. Fill in the dBm values in the measurement record 2 for corresponding signal input level.
3. Calculate the average value of the  $P_{\text{receiver}}$  values in three frequencies within a frequency band.
4. Verify the calculated  $P_{\text{receiver}}$  [dBm] values are within  $\pm 3$  dB from the average value.
5. Fill in the measurement record 2 OK or NOK.

**Expected result:**

All the measurements shall be OK.

Displayed SSI shall be displayed in [%] and updated once per second.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:51 DVB-T2: Verification of Signal Quality Indicator (SQI)</b>
<b>Section</b>	NorDig Unified 3.4.4.7.2
<b>Requirement</b>	<p>The NorDig IRD for DVB-T2 shall be provided with a signal quality indicator (SQI). The value for the SQI shall be referred to a PLP in the received signal at the NorDig IRD RF signal input.</p> <p>The signal quality indicator shall have a relative value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal quality indicator shall be updated regularly at least once per second.</p> <p>The signal quality indicator (SQI) in [%] shall be calculated for the received PLP according to the formulas defined in [1].</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the correct functionality of the signal quality indicator.</p> <p><b>Equipment:</b></p>  <p>Gaussian channel profile used i.e. no need for fading simulator.</p> <p>C/N<sub>input</sub> refers to generated DVB-T2 signal C/N at receiver input.</p> <p>C/N<sub>receiver</sub> refers to C/N determined by the receiver under test.</p>

$$C/N_{rel} = C/N_{input} - C/N_{NorDigP1}$$

$C/N_{NorDigP1}$  refers to table 3.11 at [1].

First we need to define the required  $C/N_{input}$  for the QMP2. After that we know what is the expected rescale of  $BER\_SQI_{min}$  and  $BER\_SQI_{max}$ .

**Test procedure:**

1. Set up the test instruments
2. Use the following DVB-T2 mode {32KE, 256QAMR, PP4, R3/5, G19/256} and signal bandwidth 8MHz.
3. Set the up-converter to frequency 666MHz (K45).
4. Do the channel search.
5. Determine the lowest required  $C/N$  by adjusting the  $C/N_{input}$  until the quality measurement procedure 2 error free video is fulfilled.
6. Fill in the measurement record 1 the  $C/N_{input}$  value defined as  $C/N_{receiver}$ . Later in this test procedure the value  $C/N_{receiver}$  is used for rescaling of the  $BER\_SQI_{min}$  and  $BER\_SQI_{max}$  values.
7. Decrease the  $C/N_{input}$  in 1dB step starting from highest value in measurement record 2.
8. Fill in the displayed SQI in the measurement record 2.
9. Repeat the test for the DVB-T2 mode {32KE, 256QAMR, PP4, R2/3, G1/16} and signal bandwidth 8MHz.
10. Repeat the test for the DVB-T2 mode {32KE, 256QAMR, PP2, R3/4, G1/8} and signal bandwidth 8MHz.
11. Do the calculations in the rest of the test procedure.

$SQI_{min}$  calculations:

12. Calculate  $SQI_{min}$  for all  $C/N_{input}$  values using formulas
 

$SQI_{min} = 0,$	if $C/N_{rel} - 1 < -3$ dB
$SQI_{min} = (C/N_{rel} - 1 + 3) * BER\_SQI_{min},$	if $-3$ dB $\leq C/N_{rel} - 1 \leq 3$ dB
$SQI_{min} = 100,$	if $C/N_{rel} - 1 > 3$ dB.

$SQI_{max}$  calculations:

13. Calculate  $SQI_{max}$  for all  $C/N_{input}$  values using formulas
 

$SQI_{max} = 0,$	if $C/N_{rel} + 1 < -3$ dB
$SQI_{max} = (C/N_{rel} + 1 + 3) * BER\_SQI_{max},$	if $-3$ dB $\leq C/N_{rel} + 1 \leq 3$ dB
$SQI_{max} = 100,$	if $C/N_{rel} + 1 > 3$ dB.

Where  $BER\_SQI_{min}$  is:

$BER\_SQI_{min} = 0,$	if $C/N_{rel} - 1 - (C/N_{receiver} - X) < -2.4$ dB
$BER\_SQI_{min} = 100/15,$	if $-2.4$ dB $\leq C/N_{rel} - 1 - (C/N_{receiver} - X) \leq -2$ dB
$BER\_SQI_{min} = 100/6,$	if $C/N_{rel} - 1 - (C/N_{receiver} - X) > -2$ dB.

Where  $BER\_SQI_{max}$  is:

$BER\_SQI_{max} = 0,$	if $C/N_{rel} + 1 - (C/N_{receiver} - X) < -2.4$ dB
$BER\_SQI_{max} = 100/15,$	if $-2.4$ dB $\leq C/N_{rel} + 1 - (C/N_{receiver} - X) \leq -2$ dB
$BER\_SQI_{max} = 100/6,$	if $C/N_{rel} + 1 - (C/N_{receiver} - X) > -2$ dB.

And where X is:

X = 17.6 for 32KE, 256QAMR, PP4, R3/5, G19/256, 8MHz  
 X = 19.0 for 32KE, 256QAMR, PP4, R2/3, G1/16, 8MHz  
 X = 20.8 for 32KE, 256QAMR, PP2, R3/4, G1/8, 8MHz

**Expected result:**

All the test result are OK.  
 The signal quality indicator is updated regularly once per second.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:52 DVB-T2: Changes In Modulation Parameters</b>
<b>Section</b>	NorDig Unified 3.4.5
<b>Requirement</b>	The terrestrial NorDig IRD-T2 shall automatically recover from changes in the following P1, L1 pre-signalling data and L1 post-signalling parameters at the end of a superframe without a break in the received DVB-T2 signal. An error-free TS shall be available within five seconds for any P1 and/or L1 pre-signalling change. An error-free TS shall be output within five seconds for any L1 post-signalling FEF change and within two seconds for any other L1 post-signalling change.  The terrestrial NorDig IRD-T2 shall automatically recover from changes in the following P1, L1 pre-signalling and L1 post-signalling parameters occurring at any time followed by a break in the received signal. An error-free TS shall be output within five seconds.
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<b>Purpose of test:</b> To verify that receiver can automatically recover from changes in the specified P1, L1 pre-signaling and L1 post-signaling parameter occurring at any time followed by a break in the received signal and output an error free TS.

**Equipment:**

This test includes the use of L1 post-signalling configurable signaling fields. Those fields signalize transmission parameters per PLP.

Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

This test checks receiver capability to adapt to parameter changes in broadcasted DVB-T2 signal with break in the received RF signal. The receiver shall adapt to the received signal without any user action.

Different DVB-T2 modulators from different vendors may have different time to broadcast valid signal after the change of the parameter in the broadcasted signal. This time from parameter change to valid signal is excluded from the required receiver synchronization time. Therefore, the test operator needs to know this time and take it to account when calculating the receiver synchronization time.

Synchronisation time is not tested for rotated constellation changes, but receiver operability is tested on test Task 3:36.

Synchronisation time is not tested for time interleaving length changes, but receiver operability is tested on test Task 3:53.

**Test procedure:**

1. Setup the instruments
2. Use frequency 666MHz (K45)
3. Use the following DVB-T2 mode  
32k extended, 256QAM rotated, G1/16, R2/3 and signal bandwidth 8MHz.
4. Open the switch to break the received RF signal
5. Change the following transmission parameters in turn by changing the P1, L1 pre-signaling and L1 post signalling respectively  
 FFT size: 32K,16K,8K,4K,2K and 1K  
 Bandwidth extension: yes, no  
 PAPR: no, ACE, TR  
 Guard interval: G1/32, G1/16, G1/8, G1/4, G1/128, G19/128,G19/256  
 Pilot Pattern: PP2, PP4,PP6,PP7  
 Number of data symbols: 60, 62  
 Code Rate: R3/5, R2/3, R3/4  
 Modulation: 256 QAM  
 T2 system id change from 0 to 65535 (decimal)  
 Cell id change from 0 to 65535 (decimal)  
 Network id change (optional) from 0 to 65535 (decimal)  
 T2 version change from 1.2.1 to 1.3.1  
 PLP\_id change from 1 to 2 for TS carrying installed service(s) on the receiver

	<p>Change of FEF being disabled to enabled          Changing length of the FEF, when enabled, from 0 ms to 56.875 ms (other parameters needed to be changed are specified on test Task 3:44)</p> <ol style="list-style-type: none"> <li>6. Wait for the DVB-T2 modulator output to become valid and stable (this time is modulator specific – a minimum of 15 seconds is recommended for some modulators)</li> <li>7. Close the switch to enable the RF signal to the receiver and record the time taken to achieve QMP1.</li> <li>8. Verify receiver automatically adapts to new parameter settings without any user action.</li> </ol> <p><b>Expected result:</b></p> <p>The receiver can automatically recover from changes in the specified P1, L1 pre-signaling and L1 post-signaling parameter occurring at any time followed by a break in the received signal and output an error free TS within 5 seconds (excluding modulator stabilization time) without requiring a channel scan.</p> <p>The time limits in this clause exclude the time for the DVB-T2 modulator to output a stable and valid signal.</p>

<b>Test Case</b>	<b>Task 3:56 DVB-T2: Performance: C/N performance on Gaussian channel</b>
<b>Section</b>	NorDig Unified 3.4.10.3
<b>Requirement</b>	The NorDig IRD shall have at least the QEF performance for the C/N ratios given in, Table 2.3 (PP2) and Table 2.6 (PP7) Maximum required C/N for profiles 1 and 2.
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b></p> <p>To test the required C/N for quasi error free reception in Gaussian channel.</p> <p><b>Equipment:</b></p>

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks:

Pilot pattern	PP7 (7MHz and 8MHz BW) PP2 (1.7MHz BW)
L1 post constellation	L1 post constellation must be more robust than data PLP constellation.

**Test procedure for Gaussian channel:**

1. Set up the test instruments
2. Use the following DVB-T2 mode {32k extended, 256QAM rotated, R2/3, GI1/128}
3. Set the up-converter to channel 21
4. Measure the input level to the attenuator.
5. Determine the attenuation of the attenuator and the cables.
6. Calculate the receiver input signal level and set it to -50dBm.
7. Use the value for the required C/N specified for the DVB-T2 mode in Table 2.3.
8. Do the channel search.
9. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) fulfils.
10. Fill in the measured value in dB in the measurement record.
11. Repeat the test for the rest of the frequencies, signal bandwidths and DVB-T2 modes defined in the measurement record.

**Expected result:**

The required C/N for quasi error free reception in Gaussian channel is less than specified in Table 2.6.  
If 1.7MHz signal BW is supported, the required C/N for quasi error free reception in Gaussian channel is less than specified in Table 2.3.

<b>Test Case</b>	<b>Task 3:58 DVB-T2: Performance: Minimum receiver signal input levels on Gaussian channel</b>
<b>Section</b>	NorDig Unified 3.4.10.4
<b>Requirement</b>	<p>The NorDig IRD shall provide QEF reception for the minimum signal levels (<math>P_{min}</math>) for the supported frequency range as stated below (at 290K).</p> <p>For 7 MHz Normal Bandwidth DVB-T/T2 signal: <math>P_{min} = -105.7 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>, and  For 8 MHz Normal Bandwidth DVB-T/T2 signal: <math>P_{min} = -105.2 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>, and  For 1.7 MHz Normal Bandwidth DVB-T2 signal: <math>P_{min} = -112.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>, and  For 7 MHz Extended Bandwidth DVB-T2 signal: <math>P_{min} = -105.7 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>, and  For 8 MHz Extended Bandwidth DVB-T2 signal: <math>P_{min} = -105.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>, and  For 1.7 MHz Extended Bandwidth DVB-T2 signal: <math>P_{min} = -112.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}</math>,</p> <p>C/N is specified in tables 3.7 and 3.8 (1) and NF is specified in tables 3.9 and 3.10 (1).</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<b>Purpose of test:</b>

To verify the sensitivity of the receiver on Gaussian channel over the supported frequency range.

**Equipment:**

Be careful in impedance matching of cables, adapters and etc.

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

Pilot pattern	PP7 (7MHz and 8MHz BW) PP2 (1.7MHz BW)
L1 post constellation	L1 post constellation must be more robust than data PLP constellation.

**Test procedure for the sensitivity on the gaussian channel:**

1. Set up the test instruments
2. Use the following DVB-T2 mode {32K extended, 256QAM, R2/3, GI1/128} and signal bandwidth 8MHz .
3. Set the up-converter to frequency 474MHz (K21).
4. Measure the input level to the attenuator.
5. Determine the attenuation of the attenuator and the cables.
6. Calculate the receiver input signal.
7. Do the channel search.
8. Increase the received input level from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
9. Fill in the measured value in the measurement record.
10. Repeat the test for the rest of the frequencies, DVB-T2 modes and signal bandwidths on measurement record.

**Expected result:**

Sensitivity shall be equal or better for all measured frequencies (channels) and for all DVB-T2 modes and signal bandwidths as specified in Table 2.10.

If signal bandwidth 1.7MHz is supported, the sensitivity shall be equal or better for measured frequency and for DVB-T2 mode as specified in Table 2.7.

<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the sensitivity of the receiver on frequency selective channel.</p> <p><b>Equipment:</b></p>  <pre> graph LR     TS[TS Source] --&gt; Mod[DVB-T2 modulator]     Mod --&gt; Fading[Fading simulator]     Fading --&gt; Noise[Noise generator]     Noise --&gt; Up[Up converter]     Up --&gt; Receiver[DVB-T2 receiver]     Up --- PM[Power meter]     Receiver --- Mon[Monitor]     </pre> <p>The 0 degree channel center shall be used in fading simulator (see 2.3.4) 0dB echo.</p> <p>Be careful in impedance matching of cables, adapters and etc.</p> <p>The 0dB echo profile must be activated when measuring the power level of the signal.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.</p> <p><b>Test procedure for the sensitivity on the frequency selective channel:</b></p> <p>Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.</p> <ol style="list-style-type: none"> <li>1. Set up the test instruments</li> <li>2. Use the following DVB-T2 mode {32K extended, 256QAM, PP7, R2/3, GI1/128} and signal bandwidth 8MHz.</li> <li>3. Set the up-converter to frequency 666.0 MHz (K45).</li> <li>4. Set the fading simulator to 0dB echo profile. (Delay 1.95us, 0 degree phase at</li> </ol>

- channel center and attenuation 0dB for the second path.)
5. Determine the attenuation of the attenuator and the cables.
  6. Measure the input level to the attenuator.
  7. Calculate the receiver input signal level.
  8. Increase the received input level from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
  9. Fill in the measured value in the measurement record.
  10. Verify that the channel search finds the services on measured minimum input signal level.
  11. Repeat the test for the rest of the DVB-T2 modes with signal bandwidth of 8MHz and 7MHz on the measurement record. DVB-T2 modes with 7MHz signal bandwidth are tested on center frequency 198.5MHz (K8).
  12. Optionally, repeat the test for the rest of the DVB-T2 modes with signal bandwidth of 1.7MHz on the measurement record. DVB-T2 mode with 1.7MHz signal bandwidth is tested on center frequency 206.352 MHz (9C).

**Expected result:**

Required minimum signal level shall be equal or lower in dBm than specified in Table 2.7, Table 2.8, Table 2.9 and Table 2.10 on measured frequencies, DVB-T2 modes and signal bandwidths for all echo delays.  
 If signal bandwidth 1.7MHz is supported, the required minimum signal level shall be equal or lower in dBm than specified in table 2.6 on measured frequency and for DVB-T2 mode.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:62 DVB-T2: Performance: Immunity to “digital” signals in Other Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.7.1
<b>Requirement</b>	<p>The NorDig IRD shall, for the supported frequency ranges, permit an interfering DVB-T or DVB-T2 signal with a minimum interference to signal level ratio (I/C) as stated in the NorDig Specification (1) while maintaining QEF reception.</p> <p>The requirements in this paragraph refer, for DVB-T, to the modes {8K, 64-QAM, R=2/3, Δ/Tu =1/8} and {8K, 64-QAM, R=2/3, Δ/Tu =1/4} and {8K, 64-QAM, R=3/4, Δ/Tu =1/4} and for DVB-T2 to the modes given in NorDig Specification.</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the QEF reception for digital signal interference on adjacent or other channels.</p> <p><b>Equipment:</b></p>  <p>Verify that the digital signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.</p> <p>Worst case is when wanted and interference signals are DVB-T2 modulated in extended carrier mode in adjacent channels. This test can be performed using DVB-T modulated interferer, because the performance difference is expected to be negligible. When using DVB-T modulated interferer, signal bandwidth of the DVB-T modulated signal must be selected according to frequency range, except for the signal bandwidth 1.7MHz, which is not supported in the DVB-T system.</p> <p>Many of the European countries are going to free channel 61 and upwards to other types of services than TV. In this test a DVB-T interferer is used on channels over 60 in order to measure the interference from DVB-T system for comparison reasons.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2</p>

modes in DVB-T2 test tasks.

**Test procedure:**

1. Set up the test instruments
2. Use the following DVB-T2 mode {32K extended, 256-QAM rotated, PP4, R=3/4,  $\Delta/T_U=1/16$ } and signal bandwidth 8MHz.
3. Set the channel A up-converter to 666.0MHz (K45).
4. Set the channel B up-converter to 674.0MHz (K46).
5. Set the receiver input level for the DVB-T2 signal in channel B to -20 dBm.
6. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.
7. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
8. Repeat the test when the channel B up-converter is set to frequencies 658.0 MHz (K44), 650.0 MHz (K43), 682.0 MHz (K47).
9. Repeat the test according to procedure above for the image channel<sup>1)</sup>. Set the receiver input level for the DVB-T2 signal in channel B to -20dBm.
10. Set the channel A up-converter to 786.0MHz (K60).
11. Set the channel B up-converter to 794.0MHz (K61).
12. Set the receiver input level for the DVB-T2 signal in channel B to -20 dBm.
13. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.
14. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
15. Repeat the test when the channel B up-converter is set to frequencies 770.0 MHz (K58), 778.0 MHz (K59), 802.0 MHz (K62).
16. Repeat the test according to procedure above for the image channel<sup>1)</sup>. Set the receiver input level for the DVB-T2 signal in channel B to -20dBm.
17. Change the signal bandwidth to 7MHz.
18. Use the following DVB-T2 mode {32K normal, 256-QAM rotated, R=3/4, PP2,  $\Delta/T_U=1/8$ } and signal bandwidth 7MHz.
19. Set the channel A up-converter to frequency 198.5 MHz (K8).
20. Set the channel B up-converter to frequency 205.5 MHz (K9).
21. Set the receiver input level of the DVB-T2 signal in channel B to -20dBm.
22. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is fulfilled.
23. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
24. Repeat the test when the channel B up-converter is set to frequencies 191.5 MHz (K7), 184.5 MHz (K6) and 212.5 MHz (K10). If receiver supports optional frequency ranges and signal bandwidths, repeat the test for the optional frequencies and signal bandwidths.  
For 1.7MHz DVB-T2 signal use DVB-T2 mode {8K normal, 64QAM, R=2/3, PP2,  $\Delta/T_U=1/8$ } corresponding signal bandwidth 1.535 MHz.

<sup>1)</sup> Example: if intermediate frequency IF is 36.15MHz, the image channel is calculated for channel 45 as  $666\text{MHz} + 2 * 36.15\text{MHz} = 738.3\text{MHz}$  which is close to channel 54.

**Expected result:**

The wanted DVB-T2 signal shall be QEF for the interference signal levels specified for DVB-T2 modes, signal bandwidths and supported frequencies.

<b>Test Case</b>	<b>Task 3:63 DVB-T2: Performance: Immunity to "LTE 700 MHz" signals in Other Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.7.2

<p><b>Requirement</b></p>	<p>The terrestrial NorDig IRD and IRD-T2 shall, for the supported frequency ranges, permit an interfering 4G (LTE) “700MHz” signal with a minimum interference to signal level ratio (I/C) as stated in the Table 3.18 [1] while maintaining QEF reception.</p> <p>The power of the interfering LTE signal, both BS and UE, varies with a traffic load and traffic type. The signal power of the LTE signal is defined as the power during the active part of the time varying LTE signal, referred to as the licensed power level (I).</p> <p>The I/C values shall (1) be fulfilled for LTE signals with traffic loads from 0% to 100 % (BS) and for traffic loads from low bit rate to high bit rate (UE). Low traffic loads can be the most demanding ones. The minimum I/C requirement shall be fulfilled for interfering licensed power level signal levels in the range of -25 dBm in case of UE signals and -15dBm in case of BS signals defined as licensed power of interfering signal, at the input of the IRD.</p> <p>The requirements in this paragraph refer, for DVB-T, to following modes {FFT size, modulation, code rate, guard interval, bandwidth}; {8K, 64-QAM, R=2/3, Δ/Tu =1/8, 8MHz} and {8K, 64-QAM, R=2/3, Δ/Tu =1/4, 8MHz} and {8K, 64-QAM, R=3/4, Δ/Tu =1/4, 8MHz} and and for DVB-T2 to the modes {FFT size, modulation, pilot pattern, code rate, guard interval, bandwidth} {32KE, 256-QAM R, PP4, R=2/3, Δ/Tu =1/16, 8MHz} {32KE, 256-QAM R, PP4, R=3/5, Δ/Tu =19/256, 8MHz} {32KN, 256-QAM R, PP4, R=2/3, Δ/Tu =19/256, 7MHz}</p>
<p><b>IRD Profile(s)</b></p>	<p>Basic, IRD, DVB-T2</p>
<p><b>Test procedure</b></p>	<p><b>Purpose of test:</b> To verify the QEF reception for LTE 700 MHz signal interference on adjacent or other channels.</p> <p><b>Equipment:</b></p>  <p>Verify that the interfering LTE signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.</p> <p>From IRD point of view most demanding LTE signal might be that with low traffic load.</p> <p>The LTE transmission is generated by using following LTE signal characteristics: BS 0% traffic load (LTE_BS-idle_V3_synth.wv) UE Video stream traffic (short_UE-Video-Stream_V2.wv)</p> <p>Files in I/Q file format specified above are available on NorDig homepage.</p>

Use Mode A (Single PLP) and  $L_f$  parameter settings defined in Table 2.17.

**Test procedure:**

1. Set up the test instruments
2. Use the following DVB-T2 mode {32KE, 256-QAM R, PP4, R=2/3, G =1/16, 8MHz}
3. Set the channel A up-converter to 690.0MHz (K48).
4. Set the channel B up-converter to 708.0MHz .
5. Set the LTE interfeer to UE Video traffic mode.
6. Set the receiver input level for the LTE signal in channel B to -25 dBm.
7. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.
8. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
9. Repeat the test when the channel B up-converter is set to frequencies 718.0 MHz, 728.0 MHz.
10. Set the channel B up-converter to 763.0MHz.
11. Set the LTE interfeer to BS 0% traffic load mode.
12. Set the receiver input level for the LTE signal in channel B to -15 dBm.
13. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.
14. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
15. Repeat the test when the channel B up-converter is set to frequencies 773.0 MHz, 783.0 MHz.
16. Repeat the test for the DVB-T2 mode {32KE, 256-QAM R, PP4, R=3/5, G=19/256, 8MHz}.

**Expected result:**

The wanted DVB-T2 signal shall be QEF for the interference signal levels as specified.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:64 DVB-T2: Performance: Immunity to “LTE 800 MHz” signals in Other Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.7.1
<b>Requirement</b>	<p>The DVB-T and DVB-T2 IRD shall, for the supported frequency ranges, permit an interfering LTE signal with a minimum interference to signal level ratio (I/C) as stated in the table below while maintaining QEF reception.</p> <p>The power of the LTE signal, both BS and UE, varies with a traffic load. The signal power of the LTE signal is defined as the power during the active part of the time varying LTE signal. The I/C values shall be fulfilled for traffic loads 0% to 100 % (BS) and for traffic loads from low bit rate to high bit rate (UE). Low traffic loads can be the most demanding ones. The minimum I/C requirement shall be fulfilled for -15dBm defined as licensed power of interfering signal, at the input of the IRD.</p> <p>The requirements in this paragraph refer, for DVB-T, to the modes        {8K, 64-QAM, R=2/3, Δ/Tu =1/8, 8MHz} and        {8K, 64-QAM, R=2/3, Δ/Tu =1/4, 8MHz} and        {8K, 64-QAM, R=3/4, Δ/Tu =1/4, 8MHz} and        for DVB-T2 to the modes        {32KE, 256-QAM R, PP4, R=2/3, Δ/Tu =1/16, 8MHz}        {32KE, 256-QAM R, PP4, R=3/5, Δ/Tu =19/256, 8MHz}        {32KN, 256-QAM R, PP4, R=2/3, Δ/Tu =19/256, 7MHz}</p>
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the QEF reception for LTE signal interference on adjacent or other channels.</p> <p><b>Equipment:</b></p>  <p>Verify that the interfering LTE signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.</p> <p>From IRD point of view most demanding LTE signal might be that with low traffic load.</p> <p>The LTE transmission is generated by using following LTE signal characteristics:        LTE_BS-idle_V2.wv (BS 0% traffic load)        LTE_UE_1Mbs_V2.wv (UE 1 MBit/s traffic load)</p> <p>Files in I/Q file format are available on NorDig homepage.</p> <p>Use Mode A (Single PLP) and <math>L_f</math> parameter settings defined by Teracom for the modes.</p>

<b>Test Case</b>	<b>Task 3:65 DVB-T2: Performance: Performance in Time-Varying Channels</b>
<b>Section</b>	NorDig Unified 3.4.10.9

<p><b>Requirement</b></p>	<p>The NorDig IRD shall be able to operate with all signal time variations that naturally exist in connection with fixed roof-top reception (e.g. mast sway, antenna sway) and in-house portable reception (e.g. people walking around the receiving antenna). None of the above mentioned performance parameters should be significantly negatively affected when such channel time variations exist.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 20 Hz and a delay of 20 <math>\mu</math>s, corresponding to a Doppler shift of +/- 10 Hz (after AFC), compared to a 0 dB echo with frequency separation equal to 1 Hz and a delay of 20 <math>\mu</math>s, corresponding to a Doppler shift of +/- 0.5 Hz (after AFC). The requirements in this paragraph refer for DVB-T to the modes {8K, 64-QAM, R=2/3, <math>\Delta</math>/Tu =1/8} and {8K, 64-QAM, R=2/3, <math>\Delta</math>/Tu =1/4}.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 10 Hz and a delay of 20 <math>\mu</math>s, corresponding to a Doppler shift of +/- 5 Hz (after AFC), compared to a 0 dB echo with frequency separation equal to 1 Hz and a delay of 20 <math>\mu</math>s, corresponding to a Doppler shift of +/- 0.5 Hz (after AFC). The requirement in this paragraph refer for DVB-T to the mode {8K, 64-QAM, R=3/4, <math>\Delta</math>/Tu =1/4} and for DVB-T2 to the modes given in (1). For 1.7 MHz these DVB-T2 modes apply as well, except that the FFT size is 8K</p>
<p><b>IRD Profile(s)</b></p>	<p>Basic, IRD, DVB-T2</p>
<p><b>Test procedure</b></p>	<p><b>Purpose of test:</b> To verify the reception on a channel where time variations exists.</p> <p>1.7MHz BW DVB-T2 modes are optional to test.</p> <p><b>Equipment:</b></p>  <pre> graph LR     TS[TS Source] --&gt; Mod[DVB-T modulator]     Mod --&gt; Fading[Fading simulator]     Fading --&gt; Noise[Noise generator]     Noise --&gt; Up[Up converter]     Up --&gt; Circ(( ))     Circ --- PM[Power meter]     Circ --&gt; Rec[DVB-T receiver]     Rec --- Mon[Monitor]   </pre> <p>The 0 degree channel center shall be used in fading simulator (see 2.3.5). This is valid for 0Hz doppler shift.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7Summary of DVB-T2 modes in DVB-T2 test tasks.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Set up the test instruments.</li> <li>2. Use the following DVB-T2 mode: {32K extended, 256-QAM rotated, R=3/4, <math>\Delta</math>/Tu=1/128}.</li> <li>3. Use channel K45 (666MHz).</li> <li>4. Configure path 1 to type of static, attenuation 0dB, delay 0<math>\mu</math>s.</li> <li>5. Configure path 2 to type of pure Doppler, attenuation 0dB, delay 20<math>\mu</math>s and frequency separation to 0Hz.</li> <li>6. Set the receiver input level to -50 dBm.</li> </ol>

7. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
8. Fill in the measured value in dB in the measurement record.
9. Repeat the test for the rest of the frequency separation values in the measurement record. Be careful of value which is configured in fading simulator. It can be speed, Doppler or frequency separation.
10. Fill the C/N result in the measurement record.
11. Repeat the test for the rest of the DVB-T2 modes in measurement record.

**Expected result:**

For the DVB-T2 modes the increase in the required C/N shall be less than 3dB for 0dB 20μs echo from frequency separation 1Hz to 10Hz.

**Test result(s)**

<b>Test Case</b>	<b>Task 3:66 DVB-T2: Performance: Synchronisation for varying echo power levels in SFN</b>
<b>Section</b>	NorDig Unified 3.4.10.10
<b>Requirement</b>	For the DVB-T modes {8K, 64-QAM, R=2/3, $\Delta/T_U = 1/8$ }, {8K, 64-QAM, R=2/3, $\Delta/T_U = 1/4$ } and {8K, 64-QAM, R=3/4, $\Delta/T_U = 1/4$ }, the required C/N value, specified in NorDig specification, for QEF reception shall be obtained when the channel contains two paths with relative delay from 1.95 $\mu$ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing. For the DVB-T2 modes given in Table 2.4, the required C/N value, specified in NorDig Specification, for QEF reception shall be obtained when the channel contains two paths with relative delay from 1.95 $\mu$ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing.
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2
<b>Test procedure</b>	<b>Purpose of test:</b> To verify the SFN synchronisation when the amplitude of the echo compared to the amplitude of the direct signal varies in a function of time.  1.7 MHz DVB-T2 modes not tested.  <b>Equipment:</b>

The 0 degree at channel center shall be used in fading simulator (see 2.3.5).

Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

1.7MHz signal BW DVB-T2 modes are tested on 206.352MHz (9C)

7MHz signal BW DVB-T2 modes are tested on 198.5MHz (K8)

8MHz signal BW DVB-T2 modes are tested on 666MHz (K45),

**Test procedure:**

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following DVB-T2 mode 32K extended, 256QAM, PP4, R=2/3,  $\Delta/T_U=1/16$  and signal bandwidth 8MHz and center frequency 666MHz (K45).
3. Open the switch.
4. Configure one path of the channel simulator to have a 0dB attenuation, 0 $\mu$ s delay and 0 degree phase.
5. Configure the second path of the channel simulator to have relative delay difference -100.1 $\mu$ s and attenuation 21dB (pre echo) and 0 degree phase.
6. Configure the third path of the channel simulator to have relative delay difference +100.0 $\mu$ s and attenuation 15 dB (post echo) and 0 degree phase.
7. Set the receiver input level to -50 dBm.
8. Close the switch.
9. Increase the required C/N value from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the required C/N value in dB in the measurement record.
11. Measure the rest of the required C/N values starting at the bottom of the table and upward.
12. Fill in the results in the measurement record. During the change of the delay and the attenuation, the input RF signal to receiver shall be disconnected.
13. Repeat the test for the rest of the DVB-T2 modes.

**Expected result:**

The IRD shall synchronize in all combinations defined in measurement record and the required C/N value shall not exceed the required C/N defined for profile 2: 0dB echo in table 2.3 (PP2) and table 2.4 (PP4).

**Test result(s)**

<b>Test Case</b>	<b>Task 3:68 DVB-T2: Performance: C/(N+I) Performance in SFN inside the guard interval</b>																		
<b>Section</b>	NorDig Unified 3.4.10.11																		
<b>Requirement</b>	<p>For the DVB-T2 modes shown in (1), the required C/N value for profile 2 (specified in (1)) for QEF reception shall be obtained when the channel contains two static paths with relative delay from 1.95<math>\mu</math>s up to 0.95 times guard interval length, independently of the relative amplitudes and phases of the two paths. For 1.7 MHz these DVB-T2 modes apply as well, except that the FFT size is 8K</p> <p>For specific echo attenuation, the required C/N shall not be more than 1 dB higher compared to the median value when calculated for the required C/N values over the echo delays from 1.95 <math>\mu</math>s up to 0.95 times guard interval length.</p>																		
<b>IRD Profile(s)</b>	Basic, IRD, DVB-T2

**interval:**

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following mode {32K, 256QAM, PP4, R=3/5,  $\Delta/T_U=1/16$ } and signal bandwidth 8MHz.
3. Open the switch.
4. Set the receiver input level to -50 dBm for the wanted signal.
5. Set the channel simulator relative delay difference to 260 $\mu$ s for the echo signal.
6. Close the switch.
7. Increase the echo attenuation from low value to higher value until quality measurement procedure 2 (QMP2) is fulfilled.
8. Fill in echo attenuation result in dB in the measurement record.
9. Repeat the test the rest of the combinations of the relative delays and attenuation levels defined in measurement record.. Open the switch before changing the delay and attenuation level.
10. Repeat the test for the rest of the DVB-T2 modes in the measurement record for the signal bandwidth 8MHz.
11. Set the up-converter to center frequency 198.5MHz (K8).
12. Follow the test procedure and repeat the test for the 7 MHz signal bandwidth and DVB-T2 modes defined in the measurement record according to procedure above.

**Expected result:**

All the echo attenuation values shall be equal or lower compared to NorDig Unified values in tables 3.2 and 3.23.

**Test result(s)**

## 2.4 Task 4: IP-Based Front-end

- Not yet available-

## 2.5 Task 5: MPEG2 demultiplexer

<b>Test Case</b>	<b>Task 5:1 SI utilization</b>
<b>Section</b>	NorDig Unified 4.1
<b>Requirement</b>	
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	Utilization of MPEG-2 Service Information shall be tested under Task 8.

<b>Test Case</b>	<b>Task 5:2 CA descriptor interpretation</b>
<b>Section</b>	NorDig Unified 4.1
<b>Requirement</b>	The NorDig IRD shall interpret the CA descriptor as defined in ETR 289
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	This test is covered with tests Task 13:25, Task 10:1 and Task 10:2

<b>Test Case</b>	<b>Task 5:3 Maximum transport stream data rate</b>
<b>Section</b>	NorDig Unified 4.1 and 3
<b>Requirement</b>	The NorDig IRD <b>shall</b> be able to decode an ISO/IEC 13818-1 stream with data rates up to that include all rates that the front-end may deliver as defined in NorDig Unified chapter 3. Note: The satellite front-end may deliver up to 80.4 Mbps after error correction
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> Purpose of the test is to verify that IRD supports maximum transport stream data rate.</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --&gt; B[DVB-S/C/T Modulator]     B --&gt; C[Up Converter]     C --&gt; D[DVB Receiver]     D --&gt; E[Monitor]   </pre> <p><b>Terrestrial front-end (DVB-T) only:</b> Test multiplex with the maximum bitrate of 31.67 Mbit/s and carrying one or more services with video/audio content and teletext components.</p> <p><b>Satellite front-ends only:</b> Test multiplex with the maximum bitrate of 72 Mbit/s and carrying one or more services with video/audio content and teletext components.</p> <p><b>Cable front-ends only:</b> Test multiplex with the maximum bitrate of 53,45 Mbit/s and carrying one or more services with video/audio content and teletext components.</p> <p><b>IP-front-end only:</b> <b>TBD</b></p> <p><b>Test procedure:</b></p>

	This is general requirement that will be test in front-end tests.	
	<b>Expected result:</b>

<b>Test Case</b>	<b>Task 5:8 Descrambler Performance</b>
<b>Section</b>	NorDig Unified 4.2
<b>Requirement</b>	The descrambler unit is based on the common scrambling algorithm as specified by DVB, see DVB A 011 [5]. Common Scrambling Algorithms versions 2 and 3 shall (1) be implemented in the NorDig IRD. The algorithms are available from ETSI (2). See also section 9. It shall (1) be able to descramble on transport level and on PES format. The NorDig IRD shall (1) be able to process in parallel up to at least 6 different streams (either PES or transport level) with different access conditions. Data streams without access control shall be bypassed by the descrambling unit.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<b>This test is tested in Task 10:</b>

<b>Test Case</b>	<b>Task 5:9 System clock recovery</b>
<b>Section</b>	NorDig Unified 4.3
<b>Requirement</b>	<p>During the system time clock (STC) acquisition audio and video shall be muted. (The transition shall be smooth and seamless when the customer changes the channel). The decoder shall be able to:</p> <ul style="list-style-type: none"> <li>•recover the STC using PCR with maximum jitter of +/- 10 <math>\mu</math>s.</li> <li>•track long-term variations in the frequency of the encoder's STC.</li> </ul> <p>For each service, the demultiplexer shall recover the source clock by extracting the associated PCR values received within the incoming multiplex and insert them into the appropriate Phase Locked Loop.</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the IRD is able to recover system clock with PCR jitter amplitudes of +/- 10 <math>\mu</math>s.</p> <p><b>Test Equipment:</b> Test signals are created using the test bed shown below:</p> <div data-bbox="387 969 1070 1055" data-label="Diagram"> <pre> graph LR     A[TS Source] --&gt; B[MUX]     B --&gt; C[Exciter]     C --&gt; D[IRD]     </pre> </div> <p>A transport stream including services with following components:</p> <ul style="list-style-type: none"> <li>• Service 1             <ul style="list-style-type: none"> <li>○ MPEG4 AVC HP@L3 576i 25Hz video PID with rapid variations of the PCR values</li> <li>○ MPEG4 HE AAC L2 audio PID</li> </ul> </li> <li>• Service 2             <ul style="list-style-type: none"> <li>○ MPEG4 AVC HP@L3 576i 25Hz video PID with longterm variations of the PCR values</li> <li>○ MPEG4 HE AAC L2 audio PID</li> </ul> </li> <li>• Service 3             <ul style="list-style-type: none"> <li>○ MPEG2 MP@ML 576i 25Hz video PID with rapid variations of the PCR values</li> <li>○ MPEG1 LII audio PID</li> </ul> </li> <li>• Service 4             <ul style="list-style-type: none"> <li>○ MPEG2 MP@ML 576i 25Hz video PID with longterm variations of the PCR values</li> <li>○ MPEG1 LII audio PID</li> </ul> </li> </ul> <p>Characteristics of the PCR variations are defined below.</p> <p>Rapid variation PCR(sawtooth wave)</p> <div data-bbox="424 1776 1142 1989" data-label="Figure"> <p>The diagram shows a sawtooth wave representing PCR variations. <b>Test Case</b>	<b>Task 6:8 Frame cropping</b>
<b>Section</b>	NorDig Unified 5.8
<b>Requirement</b>	<p>The NorDig IRD shall support frame cropping for H.264/AVC encoded video. Frame cropping signalling is used to indicate which area of the encoded video that should be displayed.</p> <p>For 1080 line formats, the video is encoded with 1088 lines. To indicate which area of the encoded video that should be displayed, frame cropping signalling may be used. If frame cropping information is included in the encoded video, this shall be used to decide which 8 lines should be hidden in the Decoder Composition Output. If no frame cropping signalling is available, the IRD shall crop the bottom 8 lines.</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the receiver support frame cropping.</p> <p><b>Equipment:</b></p>

		
	<p>TS containing a service with frame cropping signalling for 8 lines (1080i) and a service without frame cropping (1080i).</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Play out the transport stream containing a service with frame cropping information and another service without frame cropping information.</li> <li>2. Verify that the desired lines are cropped.</li> <li>3. Change to service without frame cropping information.</li> <li>4. Verify that the bottom 8 lines are cropped.</li> <li>5. Fill in test results</li> </ol> <p><b>Expected result:</b></p> <p>The IRD supports frame cropping correctly</p>

<b>Test Case</b>	<b>Task 6:10 High Definition Video Output and Display</b>
<b>Section</b>	NorDig Unified 5.10
<b>Requirement</b>	The NorDig STBs shall be able to use the EDID information provided by the display to determine automatically the STB output and to accept a manual setting of the STB output, as specified in section 8.6.  For NorDig iDTVs the output video shall always be converted to the display's native resolution.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<b>This requirement is tested in test case Task 9:4.</b>

<b>Test Case</b>	<b>Task 6:11 Down-conversion of High Definition Video for Standard Definition output</b>
<b>Section</b>	NorDig Unified 5.11
<b>Requirement</b>	If SCART, or any other analogue video output (Y, P <sub>b</sub> , P <sub>r</sub> , RF-PAL or CVBS) is available, the decoded High Definition video shall be down-converted by the SD Format Converter to Standard Definition resolution for output via these interfaces.  Down-conversion of pictures shall be implemented, from any of the incoming encoded HD full screen luminance resolution values (1920x1080, 1440x1080, 1280x1080, 960x1080, 1280x720, 960x720 and 640x720) to SD resolution (720x576).  When down-converting any 1:1 pixel aspect ratio format (i.e. 1280x720 or 1920x1080) in the Decoder Composition Output to 720x576 resolution, the target shall be 702x576 pixels to be centered in the 720x576 grid with nine black pixels inserted as the start of the 720 pixel active line and nine pixels inserted as the end of the 720 pixel active line.  Down-converted HD video shall be displayed as 16:9 letterbox on 4:3 displays. (Allowing center cut would limit the safe area to 4:3 for HD production, hence <i>not</i> an allowed display option).  The SD Format Converter should apply appropriate re-interlacing (field mode integration re-interlacing). It shall process and output 720x576i25 in 4:3 frame aspect ratio or 16:9 frame aspect ratio video with colours according to 5.4 Colormertry.
<b>IRD Profile(s)</b>	Basic, IRD, FE

<b>Test procedure</b>	<b>This requirement is tested in test Task 9:8</b>
-----------------------	----------------------------------------------------

<b>Test Case</b>	<b>Task 6:12 16:9 displayed on 4:3 monitors</b>
<b>Section</b>	NorDig Unified 5.12
<b>Requirement</b>	The Nordig IRDs shall have methods to display 16:9 transmitted content on a 4:3 monitor. Likewise Nordig IRDs and iDTVs shall have methods to display 4:3 transmitted content on a 16:9 monitor. The user shall have the ability to select appropriate aspect ratio for the analogue video output (SCART), see section 8.4.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the IRD can output suitable picture signals for the 4:3 screen.</p> <p>This test is not relevant for iDTV or PC based receivers in case the video is decoded to the integrated screen.</p> <p>For STBs or similar receivers with an external analog video output e.g. Y, P<sub>b</sub>, P<sub>r</sub>, RF-PAL, Y/C or CVBS, it is recommended the video aspect ratio can be re-formatted from 16:9 to 4:3 if so selected by the user. If the video signal is available on a SCART connector, the aspect ratio shall be signaled via pin 8 in the SCART connector, see test Task 7:2. Line 23 and line 623 should be masked before the letterbox conversion to avoid the irritating half lines.</p> <p><b>Test Equipment:</b> Test signals are created using the test bed shown below:</p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]     D --- F[VCR]   </pre> <p>The multiplex should contain a number of services with 4:3 picture aspect ratio, and one service with 16:9 aspect ratio. All services in the multiplex are descrambled before recording.</p> <p><b>Test procedure:</b> The IRD is tuned to a transport stream which contains a 16:9 aspect ratio video service. It is verified that the receiver can deliver a picture with the maintained 16:9 aspect ratio (Letterbox)</p> <p><b>Expected result:</b> Receiver can deliver a picture with the maintained 16:9 aspect ratio (Letterbox) on its external analog video output.</p> <p>Note: During the transition period from 4:3 to pure 16:9 transmissions, dynamical changes of the aspect ratio, e.g. 16:9 -&gt; 4:3 -&gt; 16:9, may occur in broadcasting. It is highly recommended that IRD can provide always correct aspect ratio.</p>

<b>Test Case</b>	<b>Task 7:6 AC-3: Requirements</b>
<b>Section</b>	NorDig Unified 6.2.2
<b>Requirement</b>	<p>NorDig IRD supporting E-AC-3 and AC-3 shall</p> <ul style="list-style-type: none"> <li>• decode AC-3 streams at all bit rates and sample rates listed in ETSI TS 102 366 [35] (not including Annex E).</li> <li>• (additionally) decode E-AC-3 streams with data rates from 32 kbps to 3 024 kbps and support all sample rates listed in TS 102 366 [35] Annex E.</li> <li>• be capable of transcoding E-AC-3 bitstreams to AC-3 bitstreams according to TS 102 366 [35]. Transcoding to AC-3 audio streams shall be at a fixed bit rate of 640 kbps.</li> </ul>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the IRD supports different AC-3 bit rates and sampling rates.</p> <p><b>Equipment:</b></p>

The TS shall contain services, which has

- a AC-3 (mono, stereo) audio component with relevant signaling at bit rates and sampling rates:
  - Sampling rates 32, 44,1 and 48 kHz
  - Bit rates 64, 192, 384 and 640 kbit/s
- a AC-3 (multichannel) audio component with relevant signaling at bit rates and sampling rates:
  - Sampling rates 32, 44,1 and 48 kHz
  - Bit rate 64, 192, 384 and 640 kbit/s

**Test procedure:**

1. Connect the IRD to an audio receiver, e.g. Home Theater System with HDMI.
2. Verify that service has a multichannel AC-3 audio available.
3. In receiver menu, select MPEGstereo audio.
4. Verify that AC-3 multichannel is decoded and downmixed to PCM stereo bitstream for HDMI output and if supported for HDMI ARC.
5. Verify the audio output level can be adjusted.
6. In receiver menu, select multichannel audio.
7. Verify that AC-3 multichannel is passed-through as native bitstream for HDMI output.
  
8. Verify that service has a stereo AC-3 audio available.
9. In receiver menu, select MPEGstereo audio.
10. Verify that AC-3 stereo is decoded and downmixed to PCM stereo bitstream for HDMI output and if supported for HDMI ARC.
11. Verify the audio output level can be adjusted.
12. In receiver menu, select multichannel audio.
13. Verify that AC-3 stereo is passed-through as native bitstream for HDMI output.

**Expected result:**

IRD supports for AC-3 input audio signal and down-mix to stereo.

**Test result(s)**

	Bit rate	Sampling rate	NOK or OK
mono			
stereo			
Multichannel 5.1			
Down-mix to stereo	N/A	N/A

<i>Test Case</i>	<b>Task 7:17 HE AAC: Analogue audio output</b>
<i>Section</i>	NorDig Unified 6.2.3.1
<i>Requirement</i>	<p>The NorDig IRD with SCART and/or analogue outputs shall always have an audio signal present on the analogue outputs (SCART and stereo out, see section 8.5 and to built-in loudspeakers (see note 1)) if any of the supported formats is received.</p> <p>If the NorDig IRD has analogue stereo output(s), it shall be capable of decoding and downmixing the supported audio formats for the analogue outputs.</p> <p>NorDig IRDs supporting HE-AAC (and thereby also AAC-LC) shall be capable of:</p> <ul style="list-style-type: none"> <li>• decoding HE-AAC Version 1 at Level 2 at sampling rates of 48 kHz according to ETSI TS 101 154 [29].</li> <li>• decoding, including downmixing HE-AAC Version 1 at Level 4 (multi-channel, up to 5.1) at sampling rates of 48 kHz according to ETSI TS 101 154 [29], Annex C (downmix).</li> </ul>
<i>IRD Profile(s)</i>	Basic, IRD, FE
<i>Test procedure</i>	<p><b>Purpose of test:</b></p> <p>To verify that receiver decodes HE AAC bitstream and the audio output level can be adjusted.</p> <p>This test is only mandatory for STB or IDTV with SCART or analogue audio output interface.</p> <p><b>Equipment:</b></p>

A transport stream shall contain:

- a service with HE AAC Level 2 @ 48kHz (stereo) audio component with relevant signaling.
- a service with HE AAC Level 4 @ 48kHz (multichannel) audio component with relevant signaling.

**Test procedure:**

1. Verify that services are available.
2. In receiver menu, select stereo audio.
3. Select service with HE AAC Level 2 @ 48kHz (stereo).
4. Verify that stereo audio is available at analog audio output.
5. Verify the audio output level can be adjusted.
6. Select service with HE AAC Level 4 @ 48kHz (multichannel)
7. Verify that HE AAC multichannel is downmixed to stereo at analog audio output and HE AAC stereo is available at analog audio output.
8. Verify the audio output level can be adjusted.
9. In receiver menu, select multichannel audio.
10. Verify that HE AAC multichannel is downmixed to stereo at analog audio output and HE AAC stereo is available at analog audio output.

**Expected result:**

IRD supports HE AAC stereo audio decoding to stereo audio and the audio output level can be adjusted.  
 IRD supports HE AAC multichannel audio downmixing to stereo in analog audio output(s) and the audio output level can be adjusted.

<b>Test Case</b>	<b>Task 7:18 HE AAC: HDMI output and HDMI ARC interface</b>
<b>Section</b>	NorDig Unified 6.2.3.1
<b>Requirement</b>	NorDig IRDs supporting HE-AAC shall be capable of providing the following formats on the HDMI output connector from a HE-AAC bitstream (see chapter 16 for factory default settings): <ul style="list-style-type: none"> <li>• Transcoded to AC-3 or DTS bitstream.</li> <li>• Decoded and downmixed (if &gt; 2 channels) to PCM stereo bitstream</li> </ul>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<b>Purpose of test:</b> To verify that receiver decodes/transcodes and passes-through HE AAC bitstream. When HE AAC bitstream is decoded and transcoded the audio output level can be adjusted.

This test is only relevant for IRD with HDMI output and HDMI ARC.

**Equipment:**

A transport stream contains:

- a service with HE AAC Level2 @48kHz (mono, stereo) audio component with relevant signaling.
- a service with HE AAC Level 4 @48kHz (multichannel) audio component with relevant signaling.

**Test procedure:**

1. Connect the IRD to HDMI receiver e.g. Home Theater System with HDMI.
2. Verify that services are available.
3. In receiver menu, select stereo audio.
4. Select service with HE AAC Level2@48kHz (stereo).
5. Verify that HE AAC stereo is transcoded to PCM stereo audio bitstream at HDMI output and HDMI ARC.
6. Verify the audio output level can be adjusted.
7. Select service with HE AAC Level4@48kHz (multichannel)
8. Verify that HE AAC multichannel is downmixed to PCM stereo at HDMI output and HDMI ARC.
9. Verify the audio output level can be adjusted.
10. In receiver menu, select multichannel audio.
11. Verify that HE AAC multichannel is transcoded to AC-3 or DTS multichannel at HDMI output and HDMI ARC

**Expected result:**

IRD supports HE AAC stereo audio decoding to PCM stereo bitstream at its HDMI output and HDMI ARC when stereo audio is selected. The audio output level can be adjusted.

IRD supports HE AAC multichannel audio transcoding to AC-3 and/or DTS at its HDMI output and HDMI ARC when multichannel is selected.

<i>Test Case</i>	<b>Task 7:22 Audio Prioritising – audio format and stream type</b>
<i>Section</i>	NorDig Unified 6.5
<i>Requirement</i>	<p>The NorDig IRD shall be able to select audio stream according to user selections, these settings should be stored in the IRD’s memory separately for each service. If manually selected audio is not able to be stored in the IRD’s memory per service, a global setting should be made possible to set manual prioritisation of stream type for all services. The priority for the selected audio source shall be based on the user selections and audio stream shall be selected according to the priority list in table table 6.1 below. If the user selections are not matching with the audio streams, the NorDig IRD shall always select one of the audio streams which closest suites with the user selections and will hereby provide audio to end-user.</p> <p>The user shall be able to select multi-channel audio for the digital outputs, when the outputs are equipped for multichannel audio.</p> <p>If multichannel mode is selected and if both multichannel and stereo streams are available for the selected language and audio type, the NorDig IRD shall use the multichannel audio stream to provide downmixed audio in analog audio output(s), if applicable, and suitable digital bitstream format in digital audio output(s) as e.g. in examples in Annex G (Example table when more than one audio codec is received).</p> <p>If stereo mode is selected and if both multichannel and stereo streams are available for the selected language and audio type, the NorDig IRD shall use the stereo audio source to provide audio in analog audio output(s), if applicable, and PCM stereo in digital audio output(s) as e.g. in examples in Annex G (Guidelines for NorDig IRD audio selection: “Example table when more than one audio stream is received”).</p>
<i>IRD Profile(s)</i>	Basic, IRD, FE
<i>Test procedure</i>	<p><b>Purpose of test:</b> To verify the audio priority selection and output audio format.</p> <p><b>Test Equipment:</b></p>  <pre> graph LR     TS[TS Source] --&gt; MUX[MUX]     MUX --&gt; Exciter[Exciter]     Exciter --&gt; STB[STB]     STB --&gt; Decoder[Audio decoder]   </pre> <p>Transport stream containing services with audio components (same language and audio type) listed in table below in test results.</p> <p>Suitable languages are Swedish, Finnish, Norwegian, Danish, Icelandic, Sami, Irish/Gaelic and English.</p> <p>Audio type is “normal”.</p> <p>Audio format and stream type shall be signaled in AAC_descriptor, AC-3_descriptor or E-AC-3_descriptor according to following:</p> <ol style="list-style-type: none"> <li>1) the AAC_type field in the AAC_descriptor for AAC audio,</li> <li>2) the number of channels flags in the AC-3 descriptor and Enhanced AC-</li> </ol>

3 descriptor for AC-3 and E-AC-3.  
 Correct signaling is broadcasted depending of the audio format and stream type in test results table. IRD is assumed to prioritise audio format and stream type according to list above.

**Test procedure:**

1. Setup the system
2. Verify that the audio selection is done correctly according the input formats in table below in test results
3. Repeat test with all input format in table below
4. Fill in test results

**Expected result:**

The IRD shall select the audio format and stream type correctly.

*Test result(s)*

Available inputs formats (same language and audio type)	Output on analog interface or integrated loudspeakers		OK/NOK
	When Stereo is selected (default)	When Multichannel is selected	
MPEG1 layer II & AC-3	Decoded from MPEG1 LII	Downmixed from AC-3	
MPEG1 layer II & E-AC-3	Decoded from MPEG1 LII	Downmixed from E-AC-3

<b>Section</b>	NorDig Unified 6.5
<b>Requirement</b>	The NorDig IRD shall be able to select audio stream according to user selections, these settings should be stored in the IRD’s memory separately for each service. If manually selected audio is not able to be stored in the IRD’s memory per service, a global setting should be made possible to set manual prioritisation of stream type for all services. The priority for the selected audio source shall be based on the user selections and audio stream shall be selected according to the priority list in table 6.1 below. If the user selections are not matching with the audio streams, the NorDig IRD shall always select one of the audio streams which closest suites with the user selections and will hereby provide audio to end-user.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b>                  Verify that IRD selects normal/undefined (0x00) audio component by default.</p> <p><b>Equipment:</b></p> <div style="text-align: center;">  <pre>                     graph LR                         TS[TS source] --- MUX[MUX]                         MUX --- Exciter[Exciter]                         Exciter --- DVB[DVB receiver]                     </pre> </div> <p>The TS must contain two services with several audio components for the same language,</p>

audio formats and stream type but different audio types.

Suitable languages are Swedish, Finnish, Norwegian, Danish, Icelandic, Sami, Irish/Gaelic and English.

Audio type is signaled in PMT in one or all of the following descriptors:

- 1) Supplementary\_audio\_descriptor for any stream type.
- 2) AAC\_descriptor for AAC audio.
- 3) AC-3 descriptor for AC-3 audio.
- 4) Enhanced AC-3 descriptor for E-AC-3 audio.
- 5) ISO639\_descriptor for any stream type.

IRD is assumed to prioritise the audio type signalization information in that order.

Audio format is stereo.

Stream type for all audio components is either MPEG-4 HE.AAC version 1 or E-AC-3 including metadata corresponding audio\_type.

	Service1	Service2	Frequency

- 1) ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.
- 2) Language must be the same for all audio components and it can be one of the swe/fin/nor/ice/dan/smi/gle/iri/eng/und

**Test procedure:**

1. Verify the receiver selects audio component which has normal/undefined audio by default
2. Verify user is able to select different audio components.
3. Verify that the user is able to store selected audio component in the IRD's non-volatile memory, or can be set by changing the priority defined in list in table 6.1.
4. Put IRD into standby mode and unplug the power cord
5. Turn on the IRD
6. Zap to different service and verify that the IRD is selecting wanted audio.

**Expected result:**

IRD selects the audio component that is signalled as Normal/Undefined (0x00) by default when several audio components with the same language code, audio format and stream type but different audio type are available within one service.

The user shall also be able to select between the different audio components. The user should also be able to store the selected audio component priorisation to non-volatile memory.

<i>Test Case</i>	<b>Task 7:25 Audio video synchronization</b>
<i>Section</i>	NorDig Unified 6.7.1
<i>Requirement</i>	<p>The NorDig IRDs shall not introduce more than <math>\pm 5</math> ms of relative delay between the audio and video components on the primary output (1) and not more than <math>\pm 25</math> ms between the primary video output and a secondary audio output. (2)</p> <p>The relative delay between the audio and video components shall be continuously synchronized.</p> <p>If the NorDig IRD, as a part of an integrated digital TV set (IDTV) has an audio output, the audio shall be in sync with the video display.</p> <p>Where audio leaves the IRD in an encoded form (such as in IEC61937 [45] outputs and/or HDMI outputs and/or HDMI Audio Return Channel (ARC)), the IRD shall compensate for the decoding latency of the selected audio format, as specified for the relevant reference decoder for the selected format (e.g AC-3), such that the output of the reference decoder would be <math>\pm 5</math> ms with respect to the decoded video. This applies for all audio systems that the IRD supports.</p>
<i>IRD Profile(s)</i>	Basic, IRD, FE
<i>Test procedure</i>	<p><b>Purpose of test:</b></p> <p>To verify that the relative time delay difference between video and audio on primary output satisfies the specification.</p> <p>Mandatory for IDTVs with integrated loudspeakers.</p> <p>Relevant for STB and IDTVs with audio output interfaces for analog audio,HDMI output and HDMI ARC.</p> <p><b>Equipment:</b></p>

Transport stream containing:

- a 'Bounce' video signal (fully black and white pictures).
- The audio (sound bursts) is synchronized with the video.

**Test procedure:**

If the IRD is iDTV:

1. Subjectively verify the video content in the integrated display is in synchronization with the audio content on the integrated loudspeakers.
2. If any doubt is arisen for the synchronisation accuracy, measure the synchronization with the dedicated measurement equipment.
3. If the iDTV supports analog audio output or digital audio output on HDMI output, HDMI ARC or S/PDIF, connect a receiving reference device to such an output interface.
4. Verify subjectively if the audio on the reference device is in synchronization with the video displayed on the iDTV.
5. If any doubt is arisen for the synchronisation accuracy, measure the synchronization with the dedicated measurement equipment.

If the IRD is STB:

1. Connect a receiving reference device to primary HDMI output interface.
2. Verify subjectively if the audio on the reference device is in synchronization with the video displayed on the reference device.
3. If any doubt is arisen for the synchronisation accuracy, measure the synchronization with the dedicated measurement equipment.
4. If the STB supports analog audio output or digital audio output on S/PDIF, connect a receiving reference device to such an output interface.
5. Verify subjectively if the audio on the reference device is in synchronization with the video displayed on the reference device.

**Expected result:**

If the IRD is an iDTV

- the relative delay between video on integrated display and audio on integrated loudspeakers is less than  $\pm 5$  ms.
- the relative delay between video on integrated display and audio on the analog audio output or digital audio outputs HDMI output, HDMI ARC and S/PDIF is less than  $\pm 5$  ms.

If the IRD is an STB,

	<ul style="list-style-type: none"> <li>the relative delay between video and audio on HDMI output is less than <math>\pm 5</math> ms.</li> <li>the relative delay between video on reference display and audio on analog audio output or digital audio output S/PDIF is less than <math>\pm 5</math> ms.</li> </ul> <p>The secondary display output is not measured.</p>

\* An audio analyser with HDMI-input is not common. A HDMI-to-S/PDIF-converter might be of use or other type of equipment.

Available input format	Measured Output on S/PDIF (Integrated value in LUFS)		OK/NOK
	When Stereo is selected (default) – The Target Reference Level is -23 dBFS	When Multichannel is selected – The Target Reference Level is -31 dBFS	
MPEG1 layer II i.e. measured to be -23 LUFS	-23 LUFS (same as input)	-31 LUFS (8 dB attenuation)	
AC-3 i.e. measured to be -23 LUFS with dialnorm level set to = -23 dBFS	-23 LUFS	-31 LUFS	

	E-AC-3 i.e. measured to be -23 LUFS with dialnorm level set to = -23 dBFS	-23 LUFS	-31 LUFS	
	HE AAC i.e. measured to be -23 LUFS with prog_ref_level set to = -23 dBFS	-23 LUFS	-31 LUFS	
<p>For analog (stereo) outputs, the target reference level should be leveled to -23 dBFS (as measured on a digital signal).- Make the same tests as “Stereo” as above.</p> <p>Expected result: IRD supports correct loudness levels. Make sure that the audio level drops when changing from “Stereo” mode to “Multichannel” mode and vice versa.</p>

## 2.8 Task 8: Teletext and subtitling

<b>Test Case</b>	<b>Task 8:1 Subtitling - user preferences</b>
<b>Section</b>	NorDig Unified 7.1
<b>Requirement</b>	<p>The IRD shall have user selection of subtitling preferences for 'normal' or 'hard of hearing' subtitles. The user preference settings for subtitling should be common for EBU Teletext subtitling and DVB Subtitling, see section 16 for factory default settings of the subtitling.</p> <p>Note: Correct functionality for the Hard of Hearing/hearing impaired service, requires that the Content Providers delivers this service as a mix of translated subtitling and Hard of Hearing/hearing impaired subtitling.</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	This is a general requirement which will be verified in the following test tasks

<b>Test Case</b>	<b>Task 8:2 Subtitling - Only display subtitling if match language in user preferences</b>
<b>Section</b>	NorDig Unified 7.1.2
<b>Requirement</b>	<p>The NorDig IRD shall only display subtitles, if a language of the received subtitle matches any of the NorDig IRD's user preference settings for language for subtitling. (This means that if none of languages for the received subtitle(s) match any of the IRD's user preference settings language for subtitling, then the NorDig IRD shall not display any subtitles).</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the IRD only display subtitles, if a language of the received subtitle matches any of the IRD's user preference settings for language for subtitling.</p> <p><b>Equipment:</b></p> <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]   </pre> <p><b>Test signal configuration:</b> A transport stream is used as a test signal. Within transport stream at least two services are carried with subtitling components. One of the services shall match with the subtitling language settings in IRD and the other service is not matching to any language settings.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Tune IRD to a service that includes subtitling service that matches the IRD language settings.</li> <li>2. Verify that the correct subtitling is selected</li> <li>3. Tune IRD to a service that includes subtitling service that DO NOT match the IRD language settings.</li> <li>4. Verify that the NO subtitling is selected</li> </ol> <p><b>Expected results:</b> The IRD do not display any subtiling if the user preference's subtitling language do not match with the broadcasted subtitling languages.</p>

<b>Test result(s)</b>

-------------	-------------

<i>Test Case</i>	<b>Task 8:4 Subtitling – Subtitling mode (Normal and Hard of hearing subtitling)</b>
<i>Section</i>	NorDig Unified 7.1.4
<i>Requirement</i>	<p>In case of ‘normal’ subtitling mode is selected, then the NorDig IRD shall (1) only display ‘normal’ subtitles (signalised in subtitling descriptor and/or teletext descriptor). In this ‘normal’ subtitling mode the NorDig IRD shall not display any (hard or hearing) subtitling if the subtitling stream only includes ‘hard of hearing’/‘hearing impaired’ pages.</p> <p>In case of ‘hard of hearing’ subtitling mode is selected and if no ‘hard of hearing’/‘hearing impaired’ pages are received (signalised in subtitling descriptor and/or teletext descriptor), then the NorDig IRD shall as a default use ‘normal’ subtitling pages from the same selected language.</p>
<i>IRD Profile(s)</i>	Basic, IRD, FE
<i>Test procedure</i>	<p><b>Purpose of test:</b> To verify that the IRD can handle signalisation and decoding of “hard of hearing” subtitling when they are broadcasted.or not. To check that composition pages “normal” are chosen by default instead of “hard of hearing”.</p> <p>Support for ancillary pages is not tested.</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]   </pre> <p>A transport stream containing a test services with DVB and EBU Teletext composition subtitling and “hard of hearing” components.</p> <p>Subtitling composition pages can be divided into two contents: “normal” or “hard of hearing”. Composition pages shall be enabled in mode “normal” by default. Subtitling ancillary pages can be broadcasted for more or less like a “raw data”. Ancillary pages shall be enabled by default.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Verify the “hard of hearing” subtitles are enabled</li> <li>2. Start to broadcast the “hard of hearing” subtitles according to correst PSI/SI signalization.</li> <li>3. Verify receiver is able to handle and decode the “hard of hearing” composition pages.</li> <li>4. Stop the “hard of hearing” subtitling pages broadcasting.</li> <li>5. Start the “normal” subtitling pages broadcast.</li> <li>6. Verify that the receiver automatically starts to decode “normal” subtitling pages.</li> </ol> <p><b>Expected result:</b> Hard of hearing content of the DVB and EBU Teletext subtitling is handled, displayed and decoded correctly.</p> <p>The automatic change from “normal” to “hard of hearing” subtitling pages and vice versa is not requirement in NorDig Unified. However, for convenient use of the subtitling composition pages content, a receiver manufacture may choose to have this support due to that all program content is not “hard of hearing” subtitled.</p>

<b>Test Case</b>	<b>Task 8:5 Subtitling – DVB Subtitling and subtitling priority (DVB/EBU)</b>
<b>Section</b>	NorDig Unified 7.1.5 and 7.3
<b>Requirement</b>	<p>The NorDig IRD shall be capable of decoding, as a minimum, a subset of the DVB subtitle services as specified in section 7.3.2 and transmitted in conformance with ETS 300 743 [20], and displayed using the OSD capabilities whilst decoding the full television service (video and audio) to which it is associated.</p> <p>The NorDig IRD shall be able to display both ‘normal’ and ‘hard of hearing’ subtitles, according to user preference settings.</p> <p>Within DVB Subtitling it is possible to transmit common pages for all languages and subtitling streams inside one DVB subtitling PID, this is referred to as ‘ancillary pages’. Support for ancillary pages is optional for NorDig IRD. The enabling or disabling of the subtitle ancillary pages, if available, should be user controlled, with subtitle ancillary pages enabled as default option. The selection of subtitle ancillary pages shall be independent of the enabling of subtitle composition pages.</p> <p><b>The precision of the presentation of the subtitles shall be within 2 frames.</b></p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that DVB subtitling is implemented, and that it has higher priority than Teletext subtitling.</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]     </pre> <p>A transport stream containing a test service with teletext subtitling and DVB subtitling components.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>Drop the DVB subtitling component in the mux. <b>Test Case</b>	<b>Task 8:14 Subtitling – DVB Subtitling</b>																																
<b>Section</b>	NorDig Unified 7.3.2																																

<p><b>Requirement</b></p>	<p><b>DDS:</b> The Display Definition Segment for a subtitle service shall be supported for services that implement DDS, as defined in EN 300 743 [13]. Absence of a DDS implies that the display segment width shall be assumed as 720 pixels and the height as 576 lines.</p> <p>The NorDig IRD shall at least be capable of decoding the following DVB subtitling services:</p> <p><b>Object types:</b> The handling of the object type (0x00) ‘basic object, bitmap’ shall be supported. The handling of the other object types (i.e. 0x01), ‘basic object, character’ and (0x02) ‘composite object, string of characters’) is optional.</p> <p><b>Regions:</b> The number of regions shall be according to the ETS 300 743 [22] specification, however a limitation in the display area due to memory restrictions is allowed. The total number of regions to handle shall be able to cover four complete subtitle rows (per frame) where one subtitle row shall be extendable to 1906 pixels * 60 pixels. The regions shall have the possibility to cover 457440 pixels per frame.</p> <p><b>Number of objects:</b> The number of objects shall be at least 128.</p> <p><b>CLUT:</b> The NorDig IRD receiver shall be able to handle at least one colour look-up table (CLUT) with a minimum of 16 entries per region and the possibility to have one colour scheme applied in each of the regions. It shall be possible to choose any 24-bit RGB colour into the 16 entries. The decoder shall be able to handle the mapping to the closest colour match if the decoder has some limitation in the colour presentation. The use of the non_modifying_colour flag is optional.</p> <p><b>Transparency:</b> The NorDig IRD receiver shall implement at least 5 levels of transparency; 0% (opaque), 30%, 50%, 70% and 100% (completely transparent). Implementation of additional intermediate levels of transparency is optional. Where the NorDig IRD cannot complement a particular value of semitransparency it shall replace it with the nearest value of transparency it can implement. However, if the encoded value of transparency is in the range 10%-90% it shall not be approximated as either 0% or 100% transparency. So, 9% may be approximated as 0% but 10% shall be represented with a value in the range 10% to 90%, such as 30%. Similarly, 91% may be approximated as 100%.</p> <p><b>Number of streams:</b> NorDig IRD shall support at least one DVB-subtitling streams i.e. at least support decoding of one subtitling composition page while support of one simultaneously available ancillary page is optional.</p>
<p><b>IRD Profile(s)</b></p>	<p>Basic, IRD, FE</p>

## 2.11 Task 11: The System Software Update

### 2.11.1 Test equipment summary

To configure the minimum test setup described in these test procedures, the test setup seen in Figure 3. Generic test setup for SSU / CI+ CAM test procedure can be used.

**Figure 3. Generic test setup for SSU / CI+ CAM test procedures**

Note! The needed equipment may vary depending on the used system and can be purchased from many vendors even in a compact all-in-one unit. However, most of the tests can be done using one general test setup.

The SSU / CI+ CAM service is carried within a transport stream. The TS must contain correct type of signaling information in order for the receiver to detect correct SSU / CI+ CAM service. The following sections describe minimum signaling information.

#### The NIT must contain:

- Linkage\_descriptor 0x4A to DVB SSU service using linkage\_type 0x09.

Example for linkage\_descriptor for IRD system download located at Tsid/Onid 0x0456/0x22F1.

Descriptor_tag	0x4A
Transport_stream_id	0x0456
Original_network_id	0x22F1
Service_id	0x1194
Linkage_type	0x09
OUI *)	
selector_bytes	
private_data_byte **)	

\*) DVB OUI or manufacture specific OUI

\*\*) The private\_data\_byte shall be used as specified in the DVB Data Download Specification; Part 1: Simple Profile. (ETSI TS 102 006 v1.3.1 )

**The PMT must contain:**

(The descriptor shall be placed in the component loop of the PSI PMT table.)

- Data\_broadcast\_id\_descriptor

Descriptor_tag	0x66
Data_broadcast_id	0x000A
Id_sector_bytes *)	
OUI **)	
update_type ***)	
update_versioning_flag	
update_version	
selector_bytes	
private_data_bytes	

\*) The id\_sector\_bytes shall be used as specified in the DVB Data Download Specification (ETSI TS 102 006)

\*\*) The OUI value in the PMT shall match the OUI value in the NIT linkage to SSU descriptor.

\*\*\*) Update\_type, use value below specified for simple or enhanced profiles

proprietary update solution (not allowed)	0x0
standard update carousel (i.e. without notification table) via broadcast	0x1
system software update carousel with notification table (UNT) both available via broadcast	0x2
system software update signalled via broadcast UNT, update available from the return channel	0x03
system software update signalled via broadcast UNT, update available from the Internet	0x04
Reserved for future use	0x5 – 0xFF

**The UNT must contain:**

Signalling of UNT is relevant in case of the data\_broadcast\_id\_descriptor parameter update\_type is set to 0x02 in PMT.

The parameters for different descriptors in UNT are specified below:

Descriptor_tag	0x4B
table_id	0x01
OUI <sup>1)</sup>	
processing_order <sup>2)</sup>	
common_descriptor_loop <sup>3)</sup>	
target_descriptor_loop <sup>4)</sup>	
operational_descriptor_loop <sup>5)</sup>	

1) The OUI value in the PMT shall match the OUI value in the NIT linkage to SSU descriptor.

2) Depending of the SSU OTA mechanism

3) Common\_descriptor\_loop carries information which is intended for descriptors which apply to all platform/target devices listed in target\_descriptor\_loop and operational\_descriptor\_loop

4) Target\_descriptor\_loop can contain descriptor

- target\_serial\_number\_descriptor

5) operational\_descriptor\_loop can contain descriptors

- scheduling\_descriptor

Example for scheduling\_descriptor

descriptor_tag	0x01
start_date_time	

end_date_time	
final_availability	0
periodicity_flag	
period_unit	
duration_unit	
estimated_cycle_time_unit	
period	
duration	
estimated_cycle_time	

- update\_descriptor
- ssu\_location\_descriptor
- message\_descriptor
- ssu\_subgroup\_association\_descriptor
- private\_data\_specifier\_descriptor

See more details regarding settings in DVB Data Download Specification (ETSI TS 102 006)

NorDig T2-IRD SSU OTA in DVB-T2 system

- The SSU stream is broadcasted with parameters settings PLP\_ID = 1, T2\_System\_Id = 1 and Cell\_Id = 1 in a single PLP mode.

### 2.11.2 Test cases

<b>Test Case</b>	<b>Task 11:1 IRD System software update using DVB SSU simple profile</b>
<b>Section</b>	NorDig Unified 10.1, 10.3 and 10.6
<b>Requirement</b>	<p>The NorDig IRD shall provide a software download mechanism that enables download of software modules, to add a new software module or replace an existing software module.</p> <p>The actual upgrade of NorDig IRD software shall be initiated by the user (by update user preference setting and/or by user interaction). The user shall be able to disable any automatic update in the user preference settings for SSU.</p> <p>In cases where the user is prompted to confirm an update, the user shall be able to confirm or to abort/postpone the update.</p> <p>The user should be able to control when the installation will be performed, like proceed immediately or perform update in standby. The user shall be able to choose the update approach for the IRD (tested in Task 11:4)</p> <p>Any notification to the user (pop-up message) related to SSU shall be displayed in the same language as the language setting of the IRD.</p> <p>If the system software update does not allow the normal utilization of the</p>

	<p>NorDig IRD, the user shall be warned by some means. For example, by displaying information if the display is not available,(tested in Task 11.4).</p> <p>The progress of the download shall be displayed by the NorDig IRD. If the user chooses to abort the system software upgrade, the NorDig IRD shall remind the user during next restart or shutdown of the IRD to upgrade the receiver if the new software is available over the broadcast channel.</p> <p>The IRD shall inform the user whether there is an IRD update or CIP-CAM update.</p> <p>The IRD manufacturer shall ensure that download of non-certified system-software is prevented. If the NorDig IRD System software is corrupt, the IRD manufacturer shall provide a backup mechanism, either on local storage or via download, which can make the IRD operational again.</p> <p>The NorDig IRD shall be implemented with a protection mechanism for the existing system software. It shall ensure that the existing software will not be corrupted in case the System Software Update (SSU) is interrupted before the new system software is fully downloaded.</p> <p>The NorDig IRD shall be provided with a mechanism ensuring that only newer software versions than the existing System Software are accepted.</p> <p>The IRD manufacturer shall ensure that there are not any compatibility issues if different System Software versions are broadcast via different operators.</p> <p>The NorDig IRD shall support the SSU simple profile using the signaling in NIT, BAT and PMT, in accordance with the DVB-SSU specification. The Linkage descriptor in the NIT table, for linking to the SSU service is defined in section 12.2.6 (The UNT is not used for this profile, see chapter 5 of ref ETSI TS 102 006 ).</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the IRD system software update process in broadcast channel using DVB SSU simple profile.</p> <p>The SSU end user functionality is not tested in this case. It is tested in Task 11:4 SSU end user functionality.</p> <p>This test is convenient to do parallel with Task 11:4 SSU end user functionality.</p> <p><b>Equipment:</b> Test setup described in 2.11.1 Test equipment summary</p> <p>Software to upgrade</p> <p>2 pcs IRDs with older software than the version to upgrade or older software to downgrade the IRD under testing.</p>

Selection of two different ONID for different networks corresponding country1 and country2 in the test procedure.

**Test procedure:**

1. Connect and start up the instruments.
2. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other.
3. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. The system software PID, PMT PID and SID may not conflict with each other. (Simulates three system software streams.)
4. Configure linkage\_descriptor for the two system software download streams not to be suitable for the receiver under test. The linkage\_descriptor parameters for the third download stream shall be suitable for the receiver under test. The third system software download stream shall be the last in order.
5. Fill in the test results which parameters are unmatching with the receiver under test.
6. For the frequency f2 configure linkage\_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).
7. Do a channel search and check that all the services are possible to receive.
8. Tune the receiver to a service on the frequency f1.
9. Fill in the test results if the IRD has a setting for automatic search and it is set to "auto search".
10. Initiate the download.
11. Verify that the software is being updated.
12. Fill in the test protocol.
13. Download older software to the receiver in use or use other receiver.
14. Tune the receiver to a service on the frequency f2.
15. Initiate the download again.
16. Verify that the software is being updated.
17. Fill in the test protocol.
18. Downgrade older software to the receiver in use or use another receiver with older software as broadcasted software version.
19. Initiate the download again.
20. Plug out the electric cable to corrupt the downloading of the system software.
21. Plug in the electric cable.
22. Verify that the receiver is still usable.
23. Fill in the test protocol. Fill in extended information in the comments section if the receiver ends up in an error state. Error messages etc.
24. Initiate the download again.
25. Plug out the antenna cable. (Simulates RF disturbances).
26. Plug in the antenna cable.
27. Fill in the test protocol. Fill in extended information in the comments section if the receiver ends up in an error state. Error messages etc.
28. Downgrade the IRD to the original software, or use another sample of the IRD with the original software if available.
29. Verify which ONID values correspond country1 and country2 settings in IRD.
30. Make sure that the IRDs country setting is equal to country2.
31. Configure the TS from f1 carrying the SSU service so that the ONID is equal to country1.
32. Configure the TS from f2 so that the ONID is equal to country2.
33. Fill in the test protocol which ONID values are broadcasted in TS in f1 (country1) and f2 (country2).
34. Fill in the test protocol which country settings are selected in the IRD.

	<p>35. Control that the IRD will not download and install the SSU. 36. Fill in the test protocol.</p> <p><b>Expected result:</b> Receiver performs a software update from DVB SSU simple profile OTA broadcast available stream.</p>																																		
<i>Test result(s)</i>	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">Unmatched SSU stream number</th> <th style="width: 50%;">Unmatched parameter name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">#1</td> <td></td> </tr> <tr> <td style="text-align: center;">#2</td> <td></td> </tr> </tbody> </table> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;"></th> <th style="width: 50%;">ONID value</th> </tr> </thead> <tbody> <tr> <td>ONID value in TS in f1 (country1)</td> <td></td> </tr> <tr> <td>ONID value in TS in f2 (country2)</td> <td></td> </tr> </tbody> </table> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Test points</th> <th style="width: 65%;"></th> <th style="width: 20%;">OK or NOK</th> </tr> </thead> <tbody> <tr> <td>9</td> <td>Does IRD have a setting for automatic SSU search set by default to “auto search” ?</td> <td></td> </tr> <tr> <td>10- 12</td> <td>The correct system software on the frequency f1 is upgraded.</td> <td></td> </tr> <tr> <td>13 – 17</td> <td>The correct system software, when initiated on frequency f2, is upgraded.</td> <td></td> </tr> <tr> <td>18 – 23</td> <td>Receiver starts after electric break using old (working) software.</td> <td></td> </tr> <tr> <td>24 – 27</td> <td>The receiver clarifies the RF signal reception disturbances under OTA download. <i>Test Case</i>	<b>Task 11:2 IRD System software update using DVB SSU enhanced profile - scheduling</b>
<i>Section</i>	NorDig Unified 10.1, 10.2, 10.3, 10.5 and 10.6
<i>Requirement</i>	The NorDig IRD shall support the SSU UNT Enhanced profile using the signaling in NIT, BAT, PMT, and UNT, in accordance with the DVB-SSU specification. The Linkage descriptor in the NIT table, for linking to the SSU service is defined in section 12.2.6 [1]. The descriptors of the UNT Enhanced profile shall be as specified in Section 12.7 [1].
<i>IRD Profile(s)</i>	Basic, IRD, FE

*Test procedure*

**Purpose of test:**

To verify the IRD system software update process in broadcast channel using DVB SSU enhanced profile.

The SSU end user functionality is not tested in this case. It is tested in Task 11:4 SSU end user functionality.

This test is convenient to do parallel with Task 11:4 SSU end user functionality.

**Equipment:**

Test setup described in 2.11.1 Test equipment summary

Software to upgrade suitable for SSU enhanced profile and for the IRD under test, scheduled in the future, with more than one schedule\_descriptor in UNT.

2 pcs IRDs with older software than the version to upgrade or older software to downgrade the IRD under testing.

**Test procedure:**

Refer to Task 11:1 but use DVB SSU enhanced download stream instead.

1. Connect and start up the instruments.
2. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other.
3. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. (Simulates three system software streams.)
4. Configure linkage\_descriptor for the two system software download streams not to be suitable for the receiver under test. The linkage\_descriptor parameters for the third download stream shall be suitable for the receiver under test. The third system software download stream shall be the last in order.
5. Fill in the test results which parameters are unmatching with the receiver under test.
6. Configure UNT inclusive scheduling\_descriptor by creating schedule with three scheduling descriptors, one in the past and two in the future for the system download streams.
7. For the frequency f2 configure linkage\_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).
8. Fill in the test protocol if the IRD support automatic search and it is set to "automatic search" by default.
9. Turn off the IRD and wait until IRD is standby.
10. Turn on the IRD from standby.
11. A message shall be displayed telling that a new software is available at the time specified in the scheduling\_descriptor. The IRD shall find the nearest available scheduled time.
12. Verify that both "OK to download" and "EXIT to abort" options works by verifying that download occurs at scheduled time and that no download occur when user selects EXIT.
13. Verify that IRD doesn't upgrade software at specified time and date.
14. Fill in the test protocol.
15. Turn off the IRD and wait until IRD is standby.
16. Turn on the IRD from standby.
17. A message shall be displayed telling that a new software is available at the time

	<p>specified in the scheduling_descriptor. The IRD shall find the nearest available scheduled time.</p> <ol style="list-style-type: none"> <li>18. Verify that both “OK to download ” and “EXIT to abort” options works by verifying that download occurs at scheduled time and that download occurs when user chooses “OK to download”.</li> <li>19. Verify that IRD is upgraded.</li> <li>20. Reset the IRD to its original sw.</li> <li>21. Enhanced profile with software for the IRD under test, scheduled active now, with more than one schedule_descriptor in UNT.</li> <li>22. Initiate a manual download from the menu.</li> <li>23. <b>Test Case</b>	<b>Task 11:3 IRD System software update using DVB SSU Notifications update type 0x4</b>
<b>Section</b>	NorDig Unified 10.1, 10.2, 10.3, 10.5, 10.6 and 12.7
<b>Requirement</b>	The NorDig IRD shall support the SSU notifications update type 0x4 using UNT in accordance with the DVB-SSU specification. Linkage descriptor in the NIT table, for linking to the SSU service is defined in section 12.2.6 [1]. The descriptors of the SSU UNT shall be as specified in Section 12.7 [1].
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the IRD system software update process in broadcast channel using DVB SSU Notifications. A typical use case for SSU Notification is to reach all non-connected connectable IRDs via broadcast channel with information that new SSU software is available but the new SSU software size is too large to be distributed via broadcast channel and/or requires a higher bandwidth over broadcast channel than is available. Manufacturers are recommended to:</p> <ul style="list-style-type: none"> <li>- Pre-store SSU messages in their IRDs and messages should be in all available languages that the IRD supports,</li> <li>- Mainly using the message_index (in the enhanced_message_descriptor, see 12.7.10) to reference which pre-stored message to be displayed for the user,</li> <li>- Minimise the broadcast text (in the enhanced_message_descriptor and/or message descriptor, see 12.7.10).</li> </ul> <p><b>Equipment:</b> Test setup described in 2.11.1 Test equipment summary</p> <p>Software/configuration information to enable the SSU Notification process in the IRD.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other.</li> <li>2. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. The system software PID, PMT PID and SID may not conflict with each other. (Simulates three system software streams.)</li> <li>3. Configure linkage_descriptor for the two system software download streams not to be suitable for the receiver under test. The linkage_descriptor parameters for the third download stream shall be suitable for the receiver under test. The third system software download stream shall be the last in order.</li> <li>4. For the frequency f2 configure linkage_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).</li> <li>5. Tune the receiver to a service on the frequency f1.</li> <li>6. Perform a manual software update search.</li> <li>7. Verify that a notification is presented</li> <li>8. Reset the IRD to its factory default settings.</li> <li>9. Repeat step 1-5.</li> <li>10. Perform an automatic search from standby.</li> <li>11. Turn on the IRD from standby.</li> <li>12. Verify that a notification is presented</li> <li>13. Reset the IRD to its factory default settings.</li> </ol>

	<ol style="list-style-type: none"> <li>14. Tune the receiver to a service on the frequency f2.</li> <li>15. Perform a manual software update search.</li> <li>16. ## 2.13 Task 13: Service Information

### 2.13.1 General

These test tasks differ from the normal NorDig division of the test tasks. These test tasks are not listed in that order as the requirements appear in NorDig specification. Instead the order of the test tasks are divided in to a order how the different information data shall be able to be retrieved, handled and updated by the receiver. This division in this context is defined as following:

- Static PSI/SI data is defined as a data that must be updated by the receiver in the channel search or first time initialization.
- Quasi static PSI/SI data is defined as a data that must be updated by the receiver when it is toggled between stand-by mode and active mode or vice versa.
- Dynamic PSI/SI data is defined as a data that must be updated by the receiver whenever a change in the data occurs.

In order to maintain the reference to requirements, in every test task, the requirement from the specification is referenced.

<b>Test Case</b>	<b>Task 13:1 SI: General</b>
<b>Section</b>	NorDig Unified 12.1
<b>Requirement</b>	<p>The NorDig IRD shall at least start updating for any changes in the received “quasi-static” SI data after it returns to active from stand-by mode. “Quasi static” SI-data includes NIT and SDT, i.e. SI that is typically stored in the flash memory for service navigations, such as service name, service_ID, number of services.</p> <p>The NorDig IRD shall at least start action for any changes in the received “dynamic” PSI and SI data, (PMT, EIT, TDT/TOT, running status and CA mode) within 1 second. (As a guideline for the implementation, the trigger for changes in received tables can be based on comparing the ‘version id’ in the tables).</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	This is general requirement that will be test in following tests.

<b>Test Case</b>	<b>Task 13:2 SI: General – Undefined data structures</b>
<b>Section</b>	NorDig Unified 12.1
<b>Requirement</b>	Descriptors or other data structures that are currently undefined or are unknown to NorDig IRD shall be skipped and shall not cause any harm.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> Confirm the proper function</p> <p><b>Test procedure:</b> It is a general requirement, which is tested, in the following tests.</p>

<b>Test Case</b>	<b>Task 13:3 SI: General – ‘Actual’ and ‘Other’ tables</b>
<b>Section</b>	NorDig Unified 12.1
<b>Requirement</b>	The IRD shall be able to process the PSI/SI tables, both for the ‘Actual’ and for ‘Other’ transport streams.

<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	This is a general requirement, which is tested, in the following tests.

<b>Test Case</b>	<b>Task 13:4 SI: SI data available through an API</b>
<b>Section</b>	NorDig Unified 12.1
<b>Requirement</b>	The NorDig IRD with an HbbTV-based profile (NorDig Hybrid shall support all the DVB SI additions as defined in the HbbTV v. 1.5 ETSI TS 102 796 v.1.2.1 specification [30].
<b>IRD Profile(s)</b>	Hybrid, IRD, FE
<b>Test procedure</b>	<p><b>In case of NorDig Basic without API:</b></p> <p>Not tested.</p> <p><b>In case of NorDig Enhanced:</b></p> <p>This test is part of the HbbTV Test Suite. Not tested here</p>

<b>Test Case</b>	<b>Task 13:5 SI: Text strings and field size of the SI descriptor</b>
<b>Section</b>	NorDig Unified 12.1.7
<b>Requirement</b>	The NorDig IRD shall support the character tables specified in Table 12.4.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> Check the alphabet tables.</p> <p><b>Equipment:</b></p> <pre> graph LR     A[MPEG 2-source] --&gt; B[Multiplex]     B --&gt; C[DVB-S/C/T Modulator]     C --&gt; D[Up Converter]     D --&gt; E[DVB Receiver]     E --&gt; F[Monitor]     G[SI Inserter] --- B     </pre> <p>TS containing in SI tables Nordic characters defined in character table ‘Latin Alphabet number 5’.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Play-out test stream containing SI tables with text strings that is coded “Latin Alphabet number 5”. Text strings in following SI tables shall be tested: <ul style="list-style-type: none"> <li>• NIT <ul style="list-style-type: none"> <li>○ network_name</li> <li>○ LCD v2.0 channel_list_name</li> </ul> </li> <li>• SDT <ul style="list-style-type: none"> <li>○ Service_name</li> </ul> </li> <li>• EIT <ul style="list-style-type: none"> <li>○ Short_event</li> <li>○ Extended_event</li> </ul> </li> </ul> </li> </ol>

	2. Verify that text strings are displayed as coded in “Latin Alphabet number 5”	
	<b>Expected result:</b> All text strings are displayed as defined.

<b>Test Case</b>	<b>Task 13:11 Quasi-static update of SDT_actual – linkage to NorDig simulcast replacement service</b>
<b>Section</b>	NorDig Unified 12.3.4
<b>Requirement</b>	<p>0x82, NorDig Simulcast replacement service, linkage from an (MPEG2 ) SDTV based service to an (MPEG4 AVC) HDTV replacement service with the same content. It may be used during simulcasting of a service in both an SDTV and an HDTV version on separate service ids with same content within the same original network id. This linkage may be included in the (MPEG2) SDTV service (service_type 0x01) within the SDT pointing to the HDTV version (service_type 0x19) of the service. Whenever it is used, it will be used quasi-static.</p> <p>When an SDTV service includes this NorDig simulcast replacement service linkage (0x82) pointing to the HDTV version of the service, the NorDig HD IRDs that are able to receive both the SDTV and the HDTV services shall only include the HDTV version/(service) of the two services within its TV service list.</p> <p>(Clarification: If no ‘NorDig Simulcast replacement service’ linkage is included, both services shall be included. If only the (MPEG-2) SDTV version (service_type 0x01) is possible to receive (due to e.g. reception problems/limitations), the (HDTV) IRD shall include this service even if it carries a linkage ‘NorDig simulcast replacement service’).</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the support for the linkage to simulcast replacement service in SDT_actual.</p> <p><b>Equipment:</b></p>

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.

<sup>2)</sup>Network\_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

Note 1: NorDig Simulcast replacement service has value 0x82 in linkage\_descriptor.

Note 2: Service2 in MUX2 is only for convenience that the HDTV receiver stores service2 MUX2 in the service list.

**Test procedure:**

1. Verify that the SDT\_actuallinkage\_descriptor to a simulcast replacement service1 in MUX2 points to service2 in MUX1.
2. Verify following services are able to be received and decoded:
  - Test11, Test12 and Test22
3. Remove SDT\_actual linkage\_descriptor 0x82 from SDT\_actual in MUX2
4. Toggle receiver to standby and power on it
5. Verify following services are able to be received and decoded:
  - Test11, Test12, Test21 and Test22
6. Add SDT\_actual linkage\_descriptor 0x82 to SDT\_actual in MUX2
7. Toggle receiver to standby and power on it
8. Verify following services are able to be received and decoded:
  - Test11, Test12 and Test22
  -

**Expected result:**

	<p>Verify that receiver stores only HDTV service (service2 in MUX1) instead of simulcast SDTV service (service1 in MUX2) when linkage_descriptor is signaled.</p> <p>Verify that receiver is able to receive and decode both HDTV service (service2 in MUX1) and simulcast SDTV service (service1 in MUX2) when linkage_descriptor is not signaled after updating service information quasi-statically.</p> <p>Verify that receiver stores only HDTV service (service2 in MUX1) instead of simulcast SDTV service (service1 in MUX2) when linkage_descriptor is signaled after updating service information quasi-statically.</p>

<b>Test Case</b>	<b>Task 13:25 PMT Descriptors – teletext pages, teletext subtitling and DVB subtitling</b>
<b>Section</b>	NorDig Unified 12.6.2
<b>Requirement</b>	The following descriptors are used in PMT: teletext_descriptor subtitling_descriptor
<b>IRD Profile(s)</b>	Basic, IRD, FE

<b>Test procedure</b>	<b>This requirement is tested in Test Task 8</b>
-----------------------	--------------------------------------------------

<b>Test Case</b>	<b>Task 13:26 Dynamic update of PMT PID values</b>
------------------	----------------------------------------------------

<b>Section</b>	NorDig Unified 12.1
----------------	---------------------

<b>Requirement</b>	The NorDig IRD shall at least start action for any changes in the received "dynamic" PSI and SI data, (PMT, EIT, TDT/TOT, running status and CA mode) within 1 second. (As a guideline for the implementation, the trigger for changes in received tables can be based on comparing the 'version id' in the tables)
--------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>IRD Profile(s)</b>	Basic, IRD, FE
-----------------------	----------------

<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the receiver is able to maintain reception when PID values in PMT are dropped, added or changed.</p> <p><b>Equipment:</b></p>  <table border="1" data-bbox="383 1209 1332 1467"> <thead> <tr> <th></th> <th>Service1</th> <th>Service2</th> <th></th> <th>Frequency</th> </tr> </thead> <tbody> <tr> <td><b>MUX1</b></td> <td>SID 1100</td> <td>SID 1200</td> <td></td> <td rowspan="7">Can be chosen depending of the distribution media</td> </tr> <tr> <td>TS_id 1</td> <td>S_name Test11</td> <td>S_name Test12</td> <td></td> </tr> <tr> <td>Network_id 1</td> <td>S_type 0x01</td> <td>S_type 0x01</td> <td></td> </tr> <tr> <td>ON_id<sup>1)</sup></td> <td>PMT PID 1100</td> <td>PMT PID 1200</td> <td></td> </tr> <tr> <td></td> <td>V PID 1109 incl PCR</td> <td>V PID 1209 incl PCR</td> <td></td> </tr> <tr> <td></td> <td>A PID 1108</td> <td>A PID 1208</td> <td></td> </tr> <tr> <td></td> <td>Teletext PID 1107</td> <td>Teletext PID 1207</td> <td></td> </tr> <tr> <td></td> <td>DVB Subt PID 1106</td> <td>DVB Subt PID 1106</td> <td></td> </tr> <tr> <td></td> <td>LCN1 visible</td> <td>LCN 2 visible</td> <td></td> <td></td> </tr> </tbody> </table> <p><sup>1)</sup>ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network)</p> <p>Sometimes broadcaster may drop, add or change the content of the PID. If this happens, the PMT is updated by changing the version_id.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. <b>Test Case</b>	<b>Task 13:27 Dynamic update of PMT-Component priority (stream type)</b>	
<b>Section</b>	NorDig Unified 12.6.3	
<b>Requirement</b>	<p>NorDig IRDs shall ignore advanced audio streams when it does not support such decoding those streams.</p> <p>For example, an IRD that do not include any AC-3 (down-mix) decoder, (maybe only supports pass-through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritising.</p> <p>For video decoding, NorDig IRDs shall select the service's video components, and set the default setting in accordance with the priority list in Table 6.1.</p>	
<b>IRD Profile(s)</b>	Basic, IRD, FE	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the receiver is able select video and audio components in priority order.</p> <p><b>Equipment:</b></p> <div style="text-align: center;">  <pre> graph LR     A[MPEG source] --- B[MUX 1]     B --- C[Exciter]     C --- D[DVB receiver]           </pre> </div> <p>The idea in this test is that there is always video and audio available in the receiver output or IDTV's integrated display / speakers independently which input video and audio format(s) is(are) available in the service.</p> <p>Depending of the audio selection settings (stereo or multichannel) in receiver menu system receiver shall output always audio in the correct format in the physical audio output or IDTV's integrated speakers..</p> <p>MPEG source must have capability to simultaneously with</p> <p>* video component broadcast for following video formats:</p> <ul style="list-style-type: none"> <li>• MPEG-2 MP@ML (SD)</li> </ul>	

- MPEG-4 AVC HP@L4 (HD)
- MPEG-4 AVC HP@L4 / L3 (SD)

\* audio component broadcast for following audio formats:

- MPEG-1 Layer II
- MPEG-4 HE AAC
- AC-3
- E-AC-3

	Service1	Service2	Frequency
<b>MUX1</b>	SID 1100	SID 1200	Can be chosen depending of the distribution media
TS_id 1	S_name Test11	S_name Test12	
Network_id 1	PMT PID 1100	PMT PID 1200	
ON_id <sup>1)</sup>	V PID 1109 (MPEG 2 SD)	V PID 1209 incl PCR	
	V PID 1119 (AVC HD)	A PID 1208	
	V PID 1129 (AVC SD)	Teletext PID 1207	
	A PID 1108 (MPEG1 L2)	DVB Subt PID 1106	
	A PID 1118 (HE AAC)	Logical_chan_desc 2 visible	
	A PID 1128 (E-AC-3)		
	A PID 1138 (AC-3)		
	Logical_chan_desc 1 visible		

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network)

The service PCR is broadcasted in separate PID.

**Test procedure:**

1. Control that the MUX1 have services signaled as defined in table above
2. Zap all the services and check quickly that they works.
3. Zap to service1 in MUX1
4. Drop PIDs in following order:
  - a. Video PID 1119
  - b. Video PID 1129
  - c. Audio PID 1118
  - d. Audio PID 1128
  - e. Audio PID 1138
5. Add PIDs in following order:
  - a. Video PID 1129
  - b. Video PID 1119
  - c. Audio PID 1138
  - d. Audio PID 1128
  - e. Audio PID 1118
6. Verify that the service is decoded correctly by watching the video, listening the audio

**Expected result:**

HDTV receiver: After remove and addition of the PIDs, all the component in the service are decoded correctly.

SDTV receiver: stream\_types not supported by the receiver are not affecting the receiver operability.

**Test result(s)**

Video codecs:

	Video codec	Stream_type	Priority	OK/NOK

Test Case	<b>Task 13:28 Dynamic update of PMT - Content_Protection_descriptor</b>
Section	NorDig Unified 12.6.7
Requirement	This descriptor is used to signal the content protection level for the received service, see Table 12.29. The IRD shall use the signalled Content Protection level together with the IRD's HDCP user setting to determine if HDCP shall be enabled or disabled on the HDMI output interface, see section 8.6.4. The Content Protection descriptor shall be conveyed in the descriptor loop immediately following the program_info_length field in the Program Map Table. The descriptor only applies to the service to which the program map table is applicable. If the descriptor is missing for a service, it shall be interpreted as content protection level 0x01 (see Table 12.29).
IRD Profile(s)	Basic, IRD, FE
Test procedure	<b>This requirement is tested in TestTask 9:7</b>

<b>Test Case</b>	<b>Task 13:29 Dynamic update of TDT/TOT</b>
<b>Section</b>	NorDig Unified 12.5
<b>Requirement</b>	The NorDig IRD shall have a real time clock and time/date (calendar) running continuously. The time/date (calendar) shall be updated by incoming TDT and TOT from SI. NorDig IRD shall display the correct time for each country based on TDT, TOT, and the country name selected by the user.
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the real time clock runs continuously.</p> <p><b>Equipment:</b></p>  <p><b>Test procedure for continuously running clock / calendar:</b></p> <ol style="list-style-type: none"> <li>1. Connect and start up the instruments</li> <li>2. Make sure that the TDT (Time and Date Table) and TOT (Time Offset Table) are present in the transport stream.</li> <li>3. Locate the time and date display.</li> <li>4. Check if the time and date is updated and fill in the test protocol. (Date can be tested separately and filled later in the test protocol).</li> </ol> <p><b>Expected result:</b> The time and date shall be displayed and updated in the navigator as time goes by.</p> <p><b>Purpose of test:</b> To test that the real time clock is updated from TDT and TOT information.</p> <p><b>Equipment:</b> As in previous test.</p> <p>Example of the configuration of the local_time_offset descriptor in the TOT for Sweden and from summertime to wintertime change. Date of the change is 28/10/2001 and time 01:00:00 o'clock.</p>

<b>Requirement</b>	
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	Purpose of the test: To verify if the IRD updates service list quasi-static from SDT_actual instead of NIT_actual service_list_descriptor.  Equipment:

			
	<p>Test procedure:</p> <p>Service_list in NIT is optional to broadcast. Therefore, it is important to verify how the receiver extract information from the SDT_actual and NIT_actual service_list in case the information is inconsistent.</p> <p>Transport stream shall have at least one service configured. The SDT_actual signalize the service, but the service_list_descriptor in NIT_actual shall not have the service listed.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> <li>1. Make first time installation of the IRD</li> <li>2. Verify the service_list_descriptor doesn't list at least one of the services carried within transport stream. With other words, there is inconsistent between SDT_actual and service_list_descriptor in NIT_actual</li> <li>3. Verify that all the carried services within transport stream are in the service list.</li> </ol> <p>Expected result:</p> <p>Services, carried within transport stream and listed in SDT_actual, are listed in service list independently if the services are listed in service_list_descriptor in NIT_actual.</p>		
<b>Test result(s)</b>			
<b>Conformity</b>	<input type="checkbox"/> <b>OK</b> <input type="checkbox"/> <b>Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments		
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information

<b>Test Case</b>	<b>Task 14:10 Service list – Handling of multiple channel lists from same networks and NorDig LCD</b>
<b>Section</b>	NorDig Unified 12.2.9.3.2
<b>Requirement</b>	<p>The Logical Channel Descriptor version 2 enables transmission within same network of multiple Channel lists, meaning that there might it be several channel lists available for a IRD to choose between. The NorDig IRD may treat each channel list as complete with all intended services for that network (original network id) and it is up to the broadcaster to ensure that all intended services are included in all lists.</p> <p>The NorDig IRD shall at least store the sorting from one of the available Channel lists as default, but it is recommended that theNorDig IRD store all the transmitted Channel Lists sorting that matches the IRD's country code settings (especially for IRDs that are not letting the user choose list during installation).</p> <p>When several Channel Lists are available from same network (original network id) for the IRD during first time installation (or complete re-installation), the NorDig IRD shall choose the channel list as the default one with following priority:</p> <ol style="list-style-type: none"> <li>1.The list with same country code as the IRD's user preference setting's country code. If several list available with same matching country code, the IRD shall choose the one with lowest list_id value OR let the viewer choose from a list, (typically using the channel_list_name)</li> <li>2.If no Channel list has a country code that matches the user preference setting's country</li> </ol>

channel lists IDs.

For cable and terrestrial networks, a subset of channel lists is required as long as one and same ON\_id is in concern. Transmissions in these networks are not normally dedicated for receivers with different country settings. Therefore, two channel list (e.g. ListDNKpri and ListDNKsec) with same country\_code is enough to test requirement in this test.

The channel list under test shall not be signaled with channel\_list\_ID 1. E.g. if receiver dedicated to Swedish market is under test, ListSWEpri shall be signaled with other channel\_list\_ID than 1 in order to avoid malfunction in receiver where the receiver selects first list found.

MUX1:

Channel_list_ID	Channel list name	Country_code
1	ListSWEpri	SWE
2	ListFINpri	FIN
3	ListNORpri	NOR
4	ListDNKpri	DNK
5	ListIRLpri	IRL
6	ListSWEsec	SWE
7	ListFINsec	FIN
8	ListNORsec	NOR
9	ListDNKsec	DNK
10	ListIRLsec	IRL

MUX2:

Channel_list_ID	Channel list name	Country_code
1	ListSWEpri	SWE
2	ListFINpri	FIN
3	ListNORpri	NOR
4	ListDNKpri	DNK
5	ListIRLpri	IRL
6	ListSWEsec	SWE
7	ListFINsec	FIN
8	ListNORsec	NOR
9	ListDNKsec	DNK
10	ListIRLsec	IRL

**Test procedure:**

Receiver country is equal as channel list country\_code:

1. Perform factory reset to the receiver
2. Perform channel search
3. Verify that the all services are found
4. The channel list with lowest channel list ID is automatically selected by the receiver or the user is able to select the channel list.

Receiver country is not equal as channel list country\_code:

5. Perform factory reset to the receiver
6. Perform channel search
7. Verify that the all services are found

8. The channel list is either user selectable or automatically selected by the receiver according to lowest channel list ID.

**Expected result:**

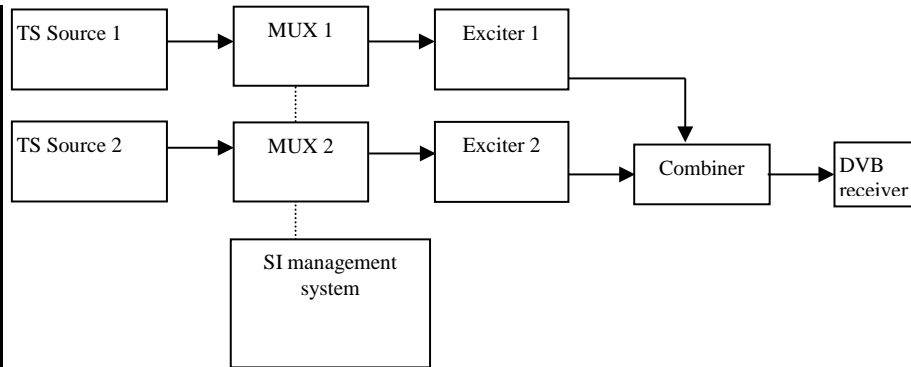

The channel list with same country code as the IRD's user preference setting's country code the IRD shall choose the one with lowest list\_id value OR let the viewer choose from a list (typically using the channel\_list\_name).

If no Channel list has a country code that matches the user preference setting's country code, the IRD shall let the viewer choose from a list (recommended) OR choose the one with lowest list\_id value.

Service name	Logical channel position(SWE)	Logical channel position(FIN)	Logical channel position(NOR)	Logical channel position(DNK)	Logical channel position(IRL)	Channel list
Test11	1	2	1	1	4	Either with lowest channel list ID (primary) or user selected
Test12	2	1	3	2	2	
Test21	3	3	2	4	3	
Test22	4	4	4	3	1

<b>Test Case</b>	<b>Task 14:11 Service list – Simultaneous transmission of LCD v1 and v2</b>
<b>Section</b>	NorDig Unified 12.2.9.4
<b>Requirement</b>	When broadcasting both LCD version 1 and version 2 within one Original Network ID, the NorDig IRDs supporting both descriptors shall only sort according to the version 2 (i.e. NorDig LCD version 2 has higher priority).
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<b>Purpose of test:</b> To verify the support for simultaneous transmission of LCD ver.1 and Ver2.  <b>Equipment:</b>

	Service1	Service2	Service3	Frequency
<b>MUX1</b> TS_id 1 Network_id 1 ON_id <sup>1)</sup>	SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN Ver.1: 1 visible LCN Ver.2: 2 visible	SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN Ver.1: 2 visible LCN Ver.2: 1 visible	SID 1300 S_name Test13 S_type 0x01 PMT PID 1300 V PID 1309 A PID 1308 LCN Ver.1: 3 visible LCN Ver.2: 3 visible	Can be chosen depending of the distribution media
<b>MUX2</b> TS_id 2 Network_id 2 ON_id <sup>1)</sup>	SID 2100 S_name Test21 S_type 0x01 PMT PID 2100 V PID 2109 A PID 2108 LCN Ver.1: 4 visible LCN Ver.2: 5 visible	SID 2200 S_name Test22 S_type 0x01 PMT PID 2200 V PID 2209 A PID 2208 LCN Ver.1: - LCN Ver.2: -		Can be chosen depending of the distribution media, but cannot be same as in MUX1

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

<sup>2)</sup>Network\_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

Note: It is not obvious that network operators will broadcast different LCN in different version of LCD. However, for testing purposes, different LCNs are broadcasted.

**Test procedure:**

1. Perform factory reset to the receiver
2. Perform automatic channel search
3. Verify that the all services are found
4. Verify that the services are stored according the LCD version 2 signaling.

**Expected result:**

The channel numbers are correct.

Service in service list should be stored as listed below:

Service name	IRD supports version 2
Test12	1
Test11	2
Test13	3
Test21	5
Test22	Last in the list

**Test result(s)**

<b>Test Case</b>	<b>Task 14:12 Service list – Simultaneous reception of multiple networks and NorDig LCD</b>
------------------	---------------------------------------------------------------------------------------------

<b>Section</b>	NorDig Unified 12.2.9.5
----------------	-------------------------

<b>Requirement</b>	<p>The NorDig IRD with terrestrial front-end shall be able to install several (DTT) original networks (with different original network ids).</p> <p>For multiple original networks (original network ids) the NorDig IRD shall first sort/list all services from one original network (original network id) according to that LCD, before sorting/listing the next original network. The first original network is the primary network and any additional received original networks are referred to as secondary network(s).</p> <p>The user shall be able to set which original network that shall be the primary, either via the user preferences, e.g. matching country setting (preferred) or via user selectable list of available original networks or similar mechanism. In order to simplify this, the NorDig IRD should map/translate the original network id into the country name. This means that for IRD where the user has set the country setting, the primary network should automatic be the country matching the original network id (and its services shall be listed first in the NorDig IRD’s service list).</p>

<b>Test Case</b>	<b>Task 14:13 Service list - Priority of LCN between SD and HDTV services</b>
<b>Section</b>	NorDig Unified 12.2.9.2.3, 12.2.9.3.4 and 13.2
<b>Requirement</b>	<p>If several services are allocated to the same logic_channel_number, (within the same channel list, as may be the case if several terrestrial regions can be received at the same location or several satellite networks are received), one service shall be ordered according to the logic_channel_number and the others shall be placed last in that list.</p> <p>Empty spaces in the broadcast logic channel numbering shall then not be used;instead they shall be located last, after the service with highest logic channel number of that service_type.(The broadcaster may quite consciously choose to leave empty spaces in the logic channel numbering, for future services, etc, in order to avoid a complete rearrangement of the list).</p>

	<p>Whenever two or more services within same category are allocated to the same logical_channel_number, the HD IRD shall priorities the advanced codec services as following for TV category; first 0x19 adv codec HDTV service, secondly 0x16 adv codec SDTV service and last 0x01 (MPEG-2 SD) TV service and for radio category; first 0x0A adv codec radio and secondly 0x02 radio service types.</p> <p>Whenever two or more services within same category are allocated to the same logical_channel_number, the NorDig HDTV IRD shall first priorities the advanced codec services as stated in Table12.1 above (see chapter 12.1.4 for priority between different services within same service category).</p>															
<p><b>IRD Profile(s)</b></p>	<p>Basic, IRD, FE</p>															
<p><b>Test procedure</b></p>	<p><b>Purpose of test:</b> To verify the support for priority of LCN between SD and HD services.</p> <p><b>Equipment:</b></p>  <table border="1" data-bbox="387 1178 1337 1653"> <thead> <tr> <th></th> <th>Service1</th> <th>Service2</th> <th>Service3</th> <th>Frequency</th> </tr> </thead> <tbody> <tr> <td><b>MUX1</b> TS_id 1 Network_id 1 ON_id <sup>1)</sup></td> <td>SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN Ver.1: 1 visible LCN Ver.2: 1 visible</td> <td>SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN Ver.1: 2 visible LCN Ver.2: 2 visible</td> <td>SID 1300 S_name Test13 S_type 0x02 PMT PID 1300  A PID 1308 LCN Ver.1: 3 visible LCN Ver.2: 3 visible</td> <td>Can be chosen depending of the distribution media</td> </tr> <tr> <td><b>MUX2</b> TS_id 1 Network_id 2 ON_id <sup>1)</sup></td> <td>SID 2100 S_name Test21 S_type 0x19 PMT PID 2100 V PID 2109 A PID 2108 LCN Ver.1: 1 visible LCN Ver.2: 1 visible</td> <td>SID 2200 S_name Test22 S_type 0x16 PMT PID 2200 V PID 2209 A PID 2208 LCN Ver.1: 2 visible LCN Ver.2: 2 visible</td> <td>SID 2300 S_name Test23 S_type 0x0A PMT PID 2300  A PID 2308 LCD ver.1: 3 visible LCD ver.2: 3 visible</td> <td>Can be chosen depending of the distribution media, but cannot be same as in MUX1</td> </tr> </tbody> </table> <p><sup>1)</sup>ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes. <sup>2)</sup>Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes</p> <p>Note 1: Receiver can use the service_type when sorting the HD and SD services. <b>Test Case</b>	<b>Task 14:14 Quasi-static update of service list – service addition</b>
<b>Section</b>	NorDig Unified 12.1 and 13.2.4
<b>Requirement</b>	<p>The IRD shall at least start updating for any changes in the received “quasi-static” SI data, (NIT and SDT i.e. SI that is normally stored in the flash memory for service navigations such as service_name, service_ID, number of services), after it return to active from stand-by mode.</p> <p>... Initiation of update in the Service List that the IRD is not able to perform in the ‘background’ without disturbances or user action/confirmation, shall (only) be made after manual power up or after user selection to an affected service/transport stream (e.g. when re-scanning is needed).</p>
<b>IRD Profile(s)</b>	Basic, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of the test:</b> To check that the IRD updates service list quasi-static when a service is added within transport stream.</p> <p><b>Equipment:</b></p> <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]     </pre> <p>NOTE: For the terrestrial networks where several transmitters can be received simultaneously, it is important to verify the parameters original_network_id, transport_stream_id and service_id to make a service unique. In cases where original_network_id and transport_stream_id are the same, but the services carried within transport stream differs, network_id can be interpreted to verify if the transport stream belongs to an other region.</p> <p><b>Test procedure:</b></p> <p>In initial phase transport stream carries at least one service. In second phase at least one new service is added inclusive the required PSI/SI signalization parameters.</p> <ol style="list-style-type: none"> <li>1. Make first time installation of the IRD or verify that the receiver doesn't have the service which will be added in the service list already installed in the service list..</li> <li>2. Check that the original service is accessed.</li> <li>3. Add a new service within transport stream             <ol style="list-style-type: none"> <li>a. Verify the service is added in SDT_actual, PAT and PMT.</li> <li>b. Verify the service is added in service in service_list_descriptor in NIT_actual</li> </ol> </li> <li>4. Toggle receiver from active mode to standby mode and from standby mode to active mode</li> <li>5. Verify the added service is added to service list.</li> </ol> <p><b>Expected result:</b> IRD automatically adds and updates the new service in the service list The service it is accessible.</p>
<b>Test result(s)</b>	<p>If possible, mark when the service addition is done:</p> <p><input type="checkbox"/> From active mode to stand-by mode</p> <p><input type="checkbox"/> From stand-by mode to active mode</p> <p><input type="checkbox"/> In stand-by mode</p>

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

<sup>2)</sup>Network\_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

**Test procedure:**

1. Verify that the private\_data\_specifier\_descriptor and NorDig\_logic\_channel\_descriptor are signaled in NIT\_actual.
2. Perform a re-initialisation and a channel search.
3. Verify that the services from MUX 1 and MUX2 are located in service list as they are signaled.
4. Fill in the measurement record 1
5. Change following configurations:
  1. remove service "Test11" from MUX1 and add this service to MUX2, rename it to "Test11 new"
  2. remove service "Test21" from MUX2 and add this service to MUX1, rename it to "Test21 new"
6. Toggle between active mode and standby mode.
7. Verify the services are stored at their logical numbers in the service list.
8. Fill in the measurement record 2.

When a move of service happens, its TS\_id and Network\_id change according to configuration in this test, the receiver shall identify the service as new and add it in the service list. When the receiver detects the service with equal LCN is removed, it shall move the service from the last positions in service list to its corresponding position signaled in LCN.

**Expected result:**

Services remain at their signaled logical channel positions after moving them between different transport streams.

**Test result(s)**

Measurement record 1:

TV list	NOK or OK
1 Test11

<sup>1)</sup> ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for all muxes

<sup>2)</sup> Network\_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

**Test procedure:**

- Verify that the private\_data\_specifier\_descriptor and NorDig\_channel\_descriptor are signaled in NIT\_actual.
- If needed perform a re-initialisation and a channel search.
- Verify that the services from MUX 1, MUX2 and MUX3 are located in service list as they are signaled.
- Fill in the measurement record 1
- Verify the service2 in MUX2 is listed last in the TV service list.
- Change the content of the following logical\_channel\_descriptors
  - service2 in MUX1: from 0 to 1 (visible)
  - service4 in MUX1: from 0 to 4 (visible)
  - service1 in MUX2: from 3 to 99 (remains visible)
  - service2 in MUX3: from 4 to 5 (remains visible)
  - service3 in MUX3: from 5 to 0 (non-visible)
  - service4 in MUX3: from 10 to 3 (remains visible)
- Toggle between active mode and standby mode.
- Verify the services are stored at their logical numbers in the service list.
- Fill in the measurement record 2.

**Expected result:**  
 Services are stored in correct type of service lists and in their signaled logical channel positions.  
 Service2 in MUX2 is listed last in the TV service list.

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

<sup>2)</sup>Network\_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

For satellite networks the channel lists represented in tables below are valid due to the capability to receive services within one and same ON\_id in different countries where even different country\_settings in receiver are relevant. The LCN is equal in all different channel lists IDs.

For cable and terrestrial networks, a subset of channel lists is required as long as one and same ON\_id is in concern. Transmissions in these networks are not normally dedicated for receivers with different country settings. Therefore, one channel list is enough to test requirement in this test.

MUX1:

Channel_list_ID	Channel list name	Country_code
1	ListSWE	SWE
2	ListFIN	FIN
3	ListNOR	NOR
4	ListDNK	DNK
5	ListICE	ICE

MUX2:

## 2.15 Task 15: PVR Functionality

<b>Test Case</b>	<b>Task 15:1 Recording File System</b>
<b>Section</b>	NorDig Unified 14.2
<b>Requirement</b>	<p>The NorDig PVR shall at all times keep a file system of the PVR's recordings and make them available upon request for the user to select and playback.</p> <p>The user shall be able to list the recordings as:</p> <ul style="list-style-type: none"> <li>all recordings, as ordered by date&amp;time</li> </ul> <p>For all recordings that have been programmed via the ESG or EPG, each recorded item in the NorDig PVR's list of recordings shall display for the user at least information about the recorded event's date of recording and event_name extracted from EIT data during the recording. If no event information is available for a specific recording then the service_name shall be used. For manual recording that span several events, it is recommended to use the service_name instead.</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD recordings file system is according requirements</p> <p><b>Test procedure:</b> This is a general requirement and will be tested in the following test tasks.</p>

<b>Test Case</b>	<b>Task 15:2 Recording capacity</b>
<b>Section</b>	NorDig Unified 14.2.2
<b>Requirement</b>	<p>The NorDig PVR shall be able to indicate its momentary available recording capacity. The basis for the indication shall be explained in the instruction manual and should be in terms of capacity (e.g. GB), percentage or time (e.g. hours).</p> <p>The Manufacture shall clearly state the recording capacity for the NorDig PVR in marketing specification and in the instruction manual. It shall as a minimum be specified in terms of bytes (like GigaByte, GB etc).</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD indicates the capacity of the mass storage.</p> <p><b>Equipment:</b> IRD Under test</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>Verify that the recording capacity is presented in the IRD menu.</li> <li>Verify that the instruction manual states clearly the recording capacity.</li> </ol> <p><b>Expected results:</b> The IRD and the instruction manual indicates the recording capacity.</p>
<b>Test result(s)</b>	
<b>Conformity</b>	<input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information
<b>Date</b>	<b>Sign</b>

<b>Test Case</b>	<b>Task 15:3 Deletion of the recordings</b>	
<b>Section</b>	NorDig Unified 14.2.3	
<b>Requirement</b>	<p>The user shall be able to manually delete any recorded event in the NorDig PVR by deleting one recording at the time.</p> <p>The NorDig PVR shall have a mode (set as factory default) where the NorDig PVR shall ask for user confirmation before deletion of recordings (i.e. the NorDig PVR may in addition have alternative mode where the NorDig PVR will delete recordings without any extra confirmation).</p>	
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that receiver that the IRD can delete PVR content.</p> <p><b>Test Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor] </pre> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Open the Receivers PVR/PDR content menu.</li> <li>2. Select one recorded program and delete it.</li> <li>3. Verify that the content is removed and PVR/PDR storage is freed.</li> <li>4. Verify that the IRD has a function that removes all recordings from the mass storage.</li> </ol> <p><b>Expected results:</b> The receiver shall handle deletion of the recorded content.</p>

<b>Date</b>		<b>Sign</b>

	<b>Task 15:15 Split recordings</b>	
<b>Section</b>	NorDig Unified 14.3.4	
<b>Requirement</b>	<p>A programme may consist of multiple EIT events within the same service or over several services. For example, a film might be divided into two parts/blocks interrupted by a news programme in the middle (see Figure 14.1 A) or a longer sport event might be split into several parts/blocks over several services, (see Figure 14.1 B).</p> <p>Signalling carried in the SI allows the PVR to identify and record all the events containing the parts of a single programme. A “split programme” is a single piece of content which comprises of two or more EIT events having the same CRID and IMI value with the gap from the scheduled end time (start_time plus duration) to the scheduled start time of any two of those events is less than 3 hours (see section 12.4.6).</p> <p>The NorDig PVR shall consider a split programme to be segments of a single item of content (1). When selecting a split programme for recording, the NorDig PVR shall select and record all constituent events so that the complete programme content is recorded.</p>	

	<p>There are cases where a NorDig PVR may during the time of programming a recording only see a single event with the booked CRID and IMI combination (for example initially only the first part/block of the split programme has so far been included in the EIT).</p> <p>The NorDig PVR shall continue to monitor the EIT for additional events with the same CRID and IMI combination and include them to the selected recording (1). In case of overlap between the split events and if the NorDig PVR has limitation in recording capacity when back-to-back recording, then the NorDig PVR shall first finalise recording of the first part/event of the split programme (according to the events start time and duration) before starting recording the next part of the split programme, This is the same behaviour as back-to-back recordings.</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD handles split recordings.</p> <p><b>Equipment:</b></p> <ul style="list-style-type: none"> <li>• IRD Under test</li> <li>• Streams with split events of same content:             <ul style="list-style-type: none"> <li>○ Stream 1: Event splitted on the same channel with max. 3 hour gap between splitted events</li> <li>○ Stream 2: Event splitted between two channels in different multiplexes without gaps between splits</li> <li>○ Stream 3: Event splitted between two channels in different multiplexes with gaps between splits (max. 3 hour)</li> <li>○ Stream 4: Event splitted between two channels in different multiplexes with overlaps between splits</li> </ul> </li> </ul> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Initiate recording of event part of a content split into several events from EPG.</li> <li>2. The IRD presents information that there are several that are part of the same content and offer to record the whole content.</li> <li>3. Repeat with all test streams</li> </ol> <p><b>Expected result:</b> The IRD is able to initiate recording of several events that are part of the same content and it is indicated in the EPG. The IRD presents this in a user friendly way.</p>

	<b>Task 15:19 Accurate Recording – EIT information present</b>
<b>Section</b>	NorDig Unified 14.3.7
<b>Requirement</b>	<p>The NorDig PVR shall determine the timing of the recording through monitoring of the EIT schedule and EIT present/following information.</p> <p>The NorDig PVR shall record at least for the duration where the event ID in the EIT present table matches the event ID of the event selected from the EIT schedule to a precision of 10 Seconds, unless there is a conflict with another recording event.</p> <p>Where the Event ID is signalled in EIT present table early (in advance of the schedule start_time) the NorDig PVR shall start recording. As a minimum the NorDig PVR shall handle early starts of at least 10 minutes, provided there are no other recordings in progress.</p> <p>The NorDig PVR shall monitor the EIT schedule and EIT present/following for updates to the start time and duration such that any event will be captured should the schedule be updated no later than 2 minutes prior to the current scheduled time of broadcast.</p> <p>Where the Event ID does not appear within EITp/f (in neither the present nor following tables) within the expected schedule time and duration the NorDig PVR should record according to the scheduled start time and duration. If the event id appears in the EIT following table at the scheduled start time, it means that the event is delayed and the NorDig PVR should wait with the start of the recording until the event ID appears in the EIT present table.</p> <p>The duration of the recording shall be changed even if the EITp/f is updated after the start time has elapsed, until the event is no longer present in the EIT present tab.</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD handles accurate recording based on the EIT information according to the PVR_rec minimum scenario.</p> <p><b>Equipment:</b> IRD Under test Stream with EIT information that is updated accurately (EIT present table), having consequent EIT schedule and EIT p/f scenarios as follows:</p> <ul style="list-style-type: none"> <li>• EIT1: Event start_time<sub>1</sub>, duration = duration<sub>1</sub>.</li> <li>• EIT2: Event start_time<sub>2</sub> = start_time<sub>1</sub>-10min and duration<sub>2</sub> ≠ duration<sub>1</sub>.</li> <li>• EIT3: Event start_time<sub>3</sub>&gt;start_time<sub>2</sub>, duration<sub>3</sub> = duration<sub>2</sub>.</li> <li>• EIT4: Event start_time<sub>4</sub>=start_time<sub>3</sub>, duration<sub>4</sub>=duration<sub>3</sub>.</li> <li>• EIT5: Event start_time<sub>5</sub>=start_time<sub>4</sub>, duration<sub>5</sub>&gt;duration<sub>4</sub>.</li> </ul> <p>Each scenario consists of multiple EIT sections:</p> <ul style="list-style-type: none"> <li>• Event shall be included in the EIT_schedule of EIT1.</li> <li>• Event shall be included in the EIT_following of EIT2 and EIT3.</li> <li>• Event shall be included in the EIT_present of EIT4 and EIT5.</li> <li>• Event start_time and duration shall be constant in EIT_schedule during the test.</li> </ul> <p>Event event_id shall be constant during the test.</p>

Event name or short\_event\_descriptor may be updated to indicate the originating EIT scenario number.

**Test procedure:**

1. Broadcast EIT schedule and EIT p/f scenario EIT1.
2. Schedule Event for recording from EPG/ESG.
3. Set IRD into the stand-by mode.
4. Update EIT scenario to EIT2, where Event start\_time and duration are updated.
5. Shortly before start\_time<sub>2</sub>, update EIT scenario to EIT3, where start\_time is delayed.
6. Update EIT scenario to EIT4 at start\_time<sub>3</sub> so that Event is the present event.
7. While Event is present, update EIT scenario to EIT5, where duration is updated.
8. Fill in the measurement record.

**Expected results:**

The IRD performs accurate recording based on the EIT present information. Recording should start at start\_time<sub>4</sub> or alternatively recording shall start at start\_time<sub>2</sub> ±10 s. Recording shall stop at start\_time<sub>5</sub>+duration<sub>5</sub>±10 s.

**Test result(s)**

Measurement record	
Test point	Result OK/NOK
IRD prioritizes EIT_present/following over EIT_schedule	
IRD handles correctly an early start of a scheduled event	
IRD handles correctly a delayed start of a scheduled event	
IRD handles EIT present duration update during recording	
Recording begins according to EIT present ±10 s.	
Recording is stopped according to EIT present ± 10 s.	
Recording is not indicated as incomplete.	
Recording is correctly viewable

	<b>Task 15:28 Back-to-back recordings – Static EIT information</b>		
<b>Section</b>	NorDig Unified 14.3.11, 14.3.16.2		
<b>Requirement</b>	The NorDig PVR shall be able to record back-to-back events both on same and on		

	<p>different services.</p> <p>Back-to-back events refer to two events that immediately follow each other, i.e. the following event start_time is immediately after the previous events stop time,(start_time plus duration).</p> <p>For overlapping events see NorDig Unified 14.3.16.2. If the first event has same or higher priority as the second event (see 14.3.16.2) and the first event will overrun, if the NorDig PVR has limitation in recording capacity, it shall first finalise recording of the first event (including its overrun part) before starting recording the next event.</p> <p>The overrun shall be treated as the more important part of the events, see figure below. If the NorDig PVR has been set to add additional recording time (“safe margins”) before and after recorded events’ start and stop time, any overlapping “safe margins” between the back-to-back events shall be removed (if the NorDig PVR has limitation in recording capacity for this)</p> <p>If a conflict occurs in a partially or completely overlapping recording after the time of programming the NorDig PVR shall prioritize the recording with the highest priority , as illustrated in figures below. For conflict with events with same priority, the NorDig PVR shall first finalize the first recording (including any late over-run) before starting with next. (See also back-to-back recording).</p>
<p><b>IRD Profile(s)</b></p>	<p>Basic, PVR, IRD, FE</p>
<p><b>Test procedure</b></p>	<p><b>Purpose of test:</b> To verify that IRD handles back-to-back recording</p> <p><b>Equipment:</b> IRD Under test Test network of at least 2 MUX, with services as follows:</p> <ul style="list-style-type: none"> <li>• Services with EIT information that indicate programs are back-to-back</li> <li>• Services with EIT information that indicate programs are overlapping</li> </ul> <p>TS1    Test11                 Test12 </p> <p>TS2    Test21                 Test22 </p> <p style="text-align: right;"><i>time</i> →</p> <p>Example: For all scheduled events, <math>start\_time_N = (start\_time_{N-1} + duration_{N-1})</math></p> <p>TS1    Test11                 Test12 </p> <p>TS2    Test21                 Test22 </p> <p style="text-align: right;"><i>time</i> →</p> <p>Example: For all scheduled events, <math>start\_time_N &lt; (start\_time_{N-1} + duration_{N-1})</math></p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. 	<b>Task 15:29 Back-to-back recordings – Changes in EIT information</b>
<b>Section</b>	NorDig Unified 14.3.11, 14.3.16.2
<b>Requirement</b>	<p>The NorDig PVR shall be able to record back-to-back events both on same and on different services.</p> <p>Back-to-back events refer to two events that immediately follow each other, i.e. the following event start_time is immediately after the previous events stop time.(start_time plus duration).</p> <p>For overlapping events see NorDig Unified 14.3.16.2. If the first event has same or higher priority as the second event (see 14.3.16.2) and the first event will overrun, if the NorDig PVR has limitation in recording capacity, it shall first finalise recording of the first event (including its overrun part) before starting recording the next event.</p> <p>The overrun shall be treated as the more important part of the events, see figure below. If the NorDig PVR has been set to add additional recording time (“safe margins”) before and after recorded events’ start and stop time, any overlapping “safe margins” between the back-to-back events shall be removed (if the NorDig PVR has limitation in recording capacity for this)</p> <p>If a conflict occurs in a partially or completely overlapping recording after the time ofprogramming the NorDig PVR shall prioritize the recording with the highest priority , as illustrated in figures below. For conflict with events with same priority, the NorDig PVR shall first finalize the first recording (including any late over-run) before starting with next. (See also back-to-back recording).</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD handles back-to-back recording with dynamic update in EIT</p> <p><b>Equipment:</b> IRD Under test Test network of at least 2 MUX, with services as follows:</p> <ul style="list-style-type: none"> <li>• Services with EIT information updated to indicate programs are back-to-back</li> <li>• Services with EIT information updated to indicate programs are overlapping</li> </ul>

Initial situation example: For all scheduled events,  $start\_time_N > (start\_time_{N-1} + duration_{N-1})$

Example: For all scheduled events,  $start\_time_N = (start\_time_{N-1} + duration_{N-1})$

Example: For all scheduled events,  $start\_time_N < (start\_time_{N-1} + duration_{N-1})$

**Test procedure:**

1. Schedule recordings from EPG as per the initial situation.
2. Update the EIT in a way that the events will be back-to-back
3. Verify that the events are recorded correctly
4. Verify that playback of the events are correct
5. Schedule recordings from EPG as per the initial situation.
6. Update the EIT in a way that the events that will be overlapping
7. Verify that the events are recorded correctly (the earlier recording has the priority)
8. Verify that playback of the events are correct

**Expected results:**

The IRD handles back-to-back recording correctly with dynamic update of EIT information

	<b>Task 15:35 Automatic Conflict Handling – After programming</b>
<b>Section</b>	NorDig Unified 14.3.16.2
<b>Requirement</b>	<p>If the NorDig PVR has a number of active programmed series recordings and if there occurs a request of more simultaneous recordings than the NorDig PVR is capable of handling, the NorDig PVR shall be able to handle this without user confirmation at the time of actual recording, i.e. the IRD may inform of the conflict via the OSD but shall automatically solve the conflict at the time of actual recording if the user does not manually change the conflict handling.</p> <p>Any information on OSD about conflict shall not be included in recording and shall have a time-out if no user reaction. All requests for user confirmation shall be done during the time of programming or during the setting of user preferences.</p> <p>The conflict(s) shall be solved with higher priority recordings having preference before recordings with a lower priority. It is up to the NorDig PVR manufacture to define the PVR's priority list, however it may typically be as prioritised in Table 14.1. Conflict(s) of recording with same priority level shall also be automatically solved (at least one of them shall be recorded), but it is up to the NorDig PVR manufacture to define a mechanism. The NorDig PVR should offer for the user the ability to change the conflict priority in the user preferences.</p>
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD detects conflict in during recording</p> <p><b>Equipment:</b> IRD Under test Live signal or test streams with EIT information updated to have overlapping events. Conflicting events shall be tested also as signalized with alternative instances, if supported by the broadcaster.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Watch a channel for a few minutes.</li> <li>2. Schedule an event 'Event' with start_time and duration for recording from ESG/EPG.</li> <li>3. 	<b>Task 15:41 Relative synchronisation</b>											
<b>Section</b>	NorDig Unified 14.4.3											
<b>Requirement</b>	The NorDig PVRs shall not introduce more relative delay (reduced “lipsync”) during playback between the audio, video and other PES packetised components (like subtitling) compared to decoding of live content, measured 5s or later after start of normal playback (see chapter 6.1.2.1 and 7). After using trick mode the relative delay shall meet the requirements within 5s after resuming back to normal playback speed.											
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE											
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that IRD sustains the ‘lipsync’ during playback and time-shift.</p> <p><b>Equipment:</b> IRD Under test Live stream or test network.</p> <p><b>Test procedure:</b></p> <p><b>The requirement in this test can be verified in parallel with the other 15:xx tasks. Subtitling synchronization is tested in tasks 15:49 and 15:50.</b></p> <ol style="list-style-type: none"> <li>1. Play back recordings with different video, audio and subtitling components.</li> <li>2. Compare the relative delay of video and audio in playback with the live content.</li> <li>3. Compare the relative delay of video and audio in timeshift with the live content.</li> <li>4. Fill in the measurement record.</li> </ol> <p><b>Expected results:</b> The IRD recovers the ‘lipsync’ during normal playback mode and time-shift after 5s.</p>											
<b>Test result(s)</b>	<table border="1" style="width: 100%;"> <tr> <td colspan="2">Measurement record</td> </tr> <tr> <td style="background-color: #cccccc;"><b>Test point</b></td> <td style="background-color: #cccccc;"><b>Result OK/NOK</b></td> </tr> <tr> <td>Video and audio components are played back in sync compared with the live content.</td> <td></td> </tr> <tr> <td>Video and audio components are played back in timeshift in sync compared with the live content.</td> <td></td> </tr> <tr> <td>Synchronization of video and audio components is settled after changing from a trick mode to normal playback speed within 5 seconds.</td> <td></td> </tr> </table>		Measurement record		<b>Test point</b>	<b>Result OK/NOK</b>	Video and audio components are played back in sync compared with the live content.		Video and audio components are played back in timeshift in sync compared with the live content.		Synchronization of video and audio components is settled after changing from a trick mode to normal playback speed within 5 seconds.	
Measurement record												
<b>Test point</b>	<b>Result OK/NOK</b>											
Video and audio components are played back in sync compared with the live content.												
Video and audio components are played back in timeshift in sync compared with the live content.												
Synchronization of video and audio components is settled after changing from a trick mode to normal playback speed within 5 seconds.

<b>Test Case</b>	<b>Task 15:42 Full service playback – Dynamic update of PMT audio language</b>
<b>Section</b>	NorDig Unified 14.4.5
<b>Requirement</b>	During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select

audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.

During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event's parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).

**IRD Profile(s)** Basic, PVR, IRD, FE

**Test procedure** **Purpose of test:**  
To verify that receiver that the Receiver handles the dynamic update of certain PSI/SI tables.

**Test Equipment:**

<sup>1)</sup>ON\_id (Original\_network\_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

Services may contain other components, e.g. teletext, subtitling and multiple additional audio tracks.

PMT of the test services shall be updated during the test so that subtitling components are added and removed in various combinations, e.g. by the following pattern:

S PID a	Lang1			Lang1	
S PID b		Lang2		Lang2	
PMT ver	n	n+1	...	...	n+k
					time

**Test procedure:**

1. Set the user preference for primary subtitling language to Lang1.
2. Set the user preference for secondary subtitling language to other than Lang1 or Lang2.
3. Start recording.
4. Select an another service.
5. Update the PMT table of the service and add/remove subtitling component(s).
6. Stop the recording.
7. Set the user preference for primary subtitling language to other than Lang1 or Lang2 and secondary subtitling language to Lang2.
8. Play back the recording.
9. Fill in the measurement record.

**Expected results:**  
The receiver shall handle updates in PMT and record/playback according to the signaling. All decodable components in PMT have been recorded.  
User preference for primary/secondary subtitling language works correctly in playback.

<b>Test result(s)</b>	Measurement record:	
	<b>Test point</b>	<b>Result OK/NOK</b>
	IRD records all decodable subtitling components in the service	
	User preference for primary/secondary subtitling language works correctly in playback.	
	Subtitling track is selected for playback dynamically by the PMT	
	PMT update and consequent subtitling track selection do not disturb the playback of other components.

<b>Test Case</b>	<b>Task 15:46 Full service playback – Subtitling for the hard-of-hearing</b>																					
<b>Section</b>	NorDig Unified 14.4.5																					
<b>Requirement</b>	<p>During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event’s parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p>																					
<b>IRD Profile(s)</b>	Basic, PVR, IRD, FE																					
<b>Test procedure</b>	<p><b>Purpose of test:</b></p> <p>To verify that the IRD can handle signalisation and decoding of “hard of hearing” subtitling when they are broadcasted or not during playback. To check that composition pages “normal” are chosen by default instead of “hard of hearing” in playback.</p> <p>Support for ancillary pages is not tested.</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]   </pre> <p>A transport stream containing test services with DVB and EBU Teletext composition subtitling and “hard of hearing” components.</p> <p>PMT of the test services shall be updated during the test so that subtitling components are added and removed in various combinations, e.g. by the following pattern:</p> <table border="1" style="margin-left: 40px;"> <tr> <td style="padding: 5px;">S PID a</td> <td style="padding: 5px; text-align: center;">Normal</td> <td style="padding: 5px; border-left: 1px dashed black;"></td> <td style="padding: 5px; border-left: 1px dashed black;"></td> <td style="padding: 5px; background-color: #cccccc;"></td> <td style="padding: 5px; text-align: center;">Normal</td> <td style="padding: 5px; background-color: #cccccc;"></td> </tr> <tr> <td style="padding: 5px;">S PID b</td> <td style="padding: 5px; background-color: #cccccc;"></td> <td style="padding: 5px; text-align: center;">HoH</td> <td style="padding: 5px; border-left: 1px dashed black;"></td> <td style="padding: 5px; text-align: center;">HoH</td> <td style="padding: 5px; border-left: 1px dashed black;"></td> <td style="padding: 5px;"></td> </tr> <tr> <td style="padding: 5px;"></td> <td style="padding: 5px; text-align: center;">n</td> <td style="padding: 5px; text-align: center;">n+1</td> <td style="padding: 5px; text-align: center;">...</td> <td style="padding: 5px; text-align: center;">...</td> <td style="padding: 5px; text-align: center;">...</td> <td style="padding: 5px; text-align: center;">n+k</td> </tr> </table> <p style="margin-left: 40px;">time →</p> <p>Subtitling composition pages can be divided into two contents: “normal” or “hard of hearing”. <b>Test Case</b>	<b>Task 15:51 Full service playback – Dynamic update of video aspect ratio</b>
<b>Section</b>	NorDig Unified 14.4.5
<b>Requirement</b>	<p>During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event’s parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p>

## 2.16 Task 16: IRD System Software and API

### 2.16.1 Introduction

This section specifies the test plans related to the NorDig Hybrid IRD.

Verified passing of the latest HbbTV official test suite [3] is a mandatory requirement for all NorDig Hybrid IRD profiles. The implementation of the HbbTV in the NorDig Hybrid IRD shall be verified by the manufacturer, i.e. the verification testing is based on self-testing by the manufacturer unless otherwise specified by the relevant network/Operator.

NorDig broadcast member may request to get a copy of the manufacture's HbbTV Verification Test report with test results, before approving a Hybrid IRD on the market.

Informative: The official HbbTV Test suite of the HbbTV Association (<http://hbbtv.org>) consists of a huge number of test cases, some of which the HbbTV Association has defined as mandatory and some as optional. The optional cases can be referred to as "additional test material". Some of these optional test cases have been contributed by NorDig and some by other testing regimes.

NorDig mandates that NorDig Hybrid IRDs shall pass:

- all test cases that are included in the latest HbbTV test suite and which HbbTV organisation has defined as mandatory
- a number of additional test cases that are included in the latest HbbTV standard test suite but which HbbTV Association has defined as optional/additional test material. These test cases are included in the list of Test Cases below. (Please Note that these test cases might be optional in standard HbbTV Test Suite and in other markets)
- a number of NorDig defined HbbTV test cases which are only included in this NorDig Test Plan.

The current HbbTV Test Suite is available from HbbTV association and it provides a set of test material to test HbbTV device implementations. It is suitable for manufacturers of devices, including hardware and software components implementing the HbbTV specification. For information on how to obtain the HbbTV Test Suite, device manufacturer should refer to <http://hbbtv.org/resource-library/#testing-information-and-support>.

NorDig has contributed into HbbTV organisation with all our NorDig-developed test cases (including test material) and these are available from the HbbTV organisation's Test Repository as "additional test material". It is recommended to use this alternative. For any party who is unable to access the HbbTV Test Repository to obtain the Nordig HbbTV Test Materials, these can be obtained via the Nordig website (<http://www.nordig.org>) as well, free of charge, but subject to accepting the Nordig Test Suite Licence Agreement (available from the Nordig website). The approved Nordig HbbTV Test Suite is identical on both sources.

Running the test cases requires access to the HbbTV Minimum Test Harness, a commercial harness or the Nordig Helper App. The latter is a tool for running the tests and obtaining the results in a meaningful way. Note that the Nordig Helper App enables only the tests designated with «org.nordig» domain to be run.

Please note that currently the Minimum Test Harness is able to run only the tests that are approved to the official HbbTV Test Suite. CI+ test cases are also mandatory to pass as they are approved to the official HbbTV Test Suite. To run the CI+ tests, a test CAM which is compatible with the test harness will be needed. This is likely to either be available through the provider of your commercial test harness, or in the case of the Minimum Test Harness from Eurofins Digital Testing. Please contact [DigitalTestingSupport@eurofins.com](mailto:DigitalTestingSupport@eurofins.com) for assistance in running the CI+ tests in the Minimum Test Harness. The Nordig HbbTV Test Suite includes the materials for tasks 16:1 to 16:59.

National testing regimes, operators and broadcasters define the final requirements for any regional certification process, and these might include additional test suites and test cases (for example DRM tests). Additional test materials are available from the latest release of the HbbTV Test Suite or from the entity organizing the testing regime. The chapter and table 2.16.2. define the test tasks that are by default mandatory to pass to pass the Nordig Test Suite part of any national regime.

Development of the Nordig Test cases is a continuous process and can be tracked in HbbTV Redmine system under the «Nordig API» -group. Redmine system can be reached from <https://hbbtv.org/redmine/projects/nordig-api-group>.

Detailed test task procedures are not repeated here – they can be accessed by referring to the xml test description files and they are visible in the RUT and PC computer screen running the test harness while executing the tests.

### 2.16.2 List of test cases

All NorDig Hybrid IRDs shall in addition to the HbbTV’s mandatory test cases also pass following listed test cases defined within the HbbTV test suite and in the current chapter below:

NorDig Test Task
Test Task
2.16 Task 16: IRD System software and API
Task 16:1 org.nordig_00000010 Current time, TDT/TOT available, NTP available
Task 16:2 org.nordig_00000020 Current time, no TDT/TOT tables, NTP available
Task 16:3 org.nordig_00000030 Current time, no TDT/TOT tables, no NTP, but SNTP is available
Task 16:4 org.nordig_00000100 parental control, blocking application
Task 16:5 org.nordig_00000300 EBU teletext, no HbbTV teletext
Task 16:6 org.nordig_00000310 HbbTV teletext, no EBU teletext
Task 16:7 org.nordig_00000320 EBU teletext and HbbTV teletext
Task 16:8 org.nordig_00000330 EBU Teletext, HbbTV teletext signalled but not available
Task 16:9 org.nordig_00000340 No EBU Teletext, no HbbTV teletext
Task 16:10 org.nordig_00000350 No EBU teletext, HbbTV teletext signalled but not available
Task 16:11 org.nordig_00000400 EBU subtitles over broadband TS, A/V object, no scaling
Task 16:12 org.nordig_00000410 EBU subtitles over broadband TS, A/V object scaled down
Task 16:13 org.nordig_00000420 EBU subtitles over broadband TS, A/V object scaled up
Task 16:14 org.nordig_00000430 DSM-CC stream events and DVB subtitles
Task 16:15 org.nordig_00000440 DSM-CC stream events and EBU subtitles
Task 16:16 org.nordig_00000500 Broadcast video scaling, 1 x 1
Task 16:17 org.nordig_00000510 Broadband TS video scaling, 1 x 1
Task 16:18 org.nordig_00000520 Broadband MP4 video scaling, 1 x 1
Task 16:19 org.nordig_00000600 EIT P/F, characters
Task 16:20 org.nordig_00000610 EIT MetadataSearch, characters
Task 16:21 org.nordig_00001010 Exit button on broadcast independent application: restore broadcast video
Task 16:22 org.nordig_00001020 Exit button: restore broadcast video from PIP mode
Task 16:23 org.nordig_00001050 Setting of preferredUILanguage
Task 16:24 org.nordig_00001060 Updating preferredUILanguage after language change in Navigator
Task 16:25 org.nordig_00001070 Switch subtitles: DVB to EBU teletext
Task 16:26 org.nordig_00001080 Switch subtitles: EBU teletext to DVB
Task 16:27 org.nordig_00001081 Switch subtitles over broadband TS: EBU teletext to DVB
Task 16:28 org.nordig_00001082 Switch subtitles over broadband TS: DVB teletext to EBU
Task 16:29 org.nordig_00001100 Disabling subtitles
Task 16:30 org.nordig_00001101 Disabling subtitles over broadband TS
Task 16:31 org.nordig_00001200 DVB subtitles - V/B Object not bound to current channel
Task 16:32 org.nordig_00001210 DVB subtitles - V/B Object bound to current channel
Task 16:33 org.nordig_00001220 EBU Teletext subtitles: Video/Broadcast Object not bound to current channel
Task 16:34 org.nordig_00001230 EBU Teletext subtitles: Video/Broadcast Object bound to current channel
Task 16:35 org.nordig_00001240 DVB subtitles placed behind application, V/B Object not bound to current channel
Task 16:36 org.nordig_00001250 DVB subtitles placed behind application, V/B Object bound to current channel
Task 16:37 org.nordig_00001260 EBU Teletext subtitles behind application, V/B Object not bound to current channel
Task 16:38 org.nordig_00001270 EBU Teletext subtitles behind application, V/B Object bound to current channel
Task 16:39 org.nordig_00001280 DVB subtitles, V/B object scaled down (1/4 x 1/4)
Task 16:40 org.nordig_00001290 DVB subtitles, V/B object scaled up ( 2 x 2 )
Task 16:41 org.nordig_00001300 DVB subtitles behind application, V/B object scaled down ( 1/4 x 1/4 )
Task 16:42 org.nordig_00001310 DVB subtitles behind application V/B object scaled up ( 2 x 2 )
Task 16:43 org.nordig_00001320 EBU Teletext subtitles, V/B object scaled down (1/4 x 1/4)
Task 16:44 org.nordig_00001330 EBU Teletext subtitles, V/B object scaled up ( 2 x 2 )
Task 16:45 org.nordig_00001340 EBU Teletext subtitles behind application, V/B object scaled down ( 1/4 x 1/4 )
Task 16:46 org.nordig_00001341 EBU Teletext subtitles over broadband TS behind application, A/V object scaled down (1/4x1/4)
Task 16:47 org.nordig_00001350 EBU Teletext subtitles behind application, V/B object scaled up ( 2 x 2 )
Task 16:48 org.nordig_00001400 DVB subtitles, A/V object - no scaling
Task 16:49 org.nordig_00001410 DVB subtitles, A/V object scaled down
Task 16:50 org.nordig_00001420 DVB subtitles, A/V object scaled up ( 2 x 2 )
Task 16:51 HbbTV global setting
Task 16:52 es.tdthibrida_7D7C0040 Broadband DVB subtitles in a TS are displayed
Task 16:53 es.tdthibrida_7D7C0050 Broadband Teletext subtitles in a TS are displayed
Task 16:54 es.tdthibrida_7D7C0060 Broadband Subtitles Below Application Graphics
Task 16:55 fr.hdforum_00151240 EXIT function is provided by receiver
Task 16:56 fr.hdforum_00151250 Termination of autostart application using EXIT function
Task 16:57 fr.hdforum_00151260 Termination of non-autostart broadcast-related application using EXIT function
Task 16:58 es.tdthibrida_7D7C0070 Auto-start applications enabled by default
Task 16:59 fr.hdforum_00151000 Application launching with network connection available
Task 16:60 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext (8:6)
Task 16:61 Subtitling - coexistent with HbbTV applications (8:7)
Task 16:62 Remote Control Key event mapping for NorDig Hybrid (9:11)

**2.16.3 Test cases**

<b>Test Case</b>	<b>Task 16:1 – 16:50</b>	
<b>Section</b>	Multiple (see test case descriptions)	
<b>Requirement</b>	Multiple (see test case descriptions)	
<b>IRD Profile(s)</b>	Hybrid	
<b>Test procedure</b>	Purpose of test: See the test case description from the Test Harness / Helper app UI  Equipment: HbbTV Test Harness or NorDig Test Suite helper app  Test procedure: Run the test using the Test Harness or helper app. Follow the on-screen instructions.  Expected result: PASS	
<b>Test result(s)</b>	Test Harness returns PASS [OK] or FAIL [Fault], mark the result below.	
<b>Conformity</b>	<input type="checkbox"/> <b>OK [PASS]</b> <input type="checkbox"/> <b>Fault [NOT OK]</b>	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 16:51 HbbTV Global setting</b>	
<b>Section</b>	Nordig Unified 15.2	
<b>Requirement</b>	The NorDig Hybrid IRD shall have HbbTV feature as enabled by default (see Section 16.3). It shall have a menu option to allow user to enable / disable the HbbTV feature as a whole and it should have a menu option to allow user to enable / disable the HbbTV feature service by service.	
<b>IRD Profile(s)</b>	Hybrid	
<b>Test procedure</b>	Purpose of test: Verify that the IRD has an option to turn HbbTV on and off globally.  Equipment: IRD under test. Stream with a HbbTV application signalled.  Test procedure: <ol style="list-style-type: none"> <li>1. Turn HbbTV setting OFF</li> <li>2. Check that HbbTV application is not launched.</li> <li>3. Turn HbbTV setting ON</li> <li>4. Check that HbbTV application is launched.</li> </ol> Expected result: PASS	
<b>Test result(s)</b>	[OK] or FAIL [Fault], mark the result below.	
<b>Conformity</b>	<input type="checkbox"/> <b>OK</b> <input type="checkbox"/> <b>Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 16:52 – 16:59 (es.TDThibrida and fr.HDFForum tests)</b>	
<b>Section</b>	Multiple (see test case descriptions)	
<b>Requirement</b>	Multiple (see test case descriptions)	
<b>IRD Profile(s)</b>	Hybrid	
<b>Test procedure</b>	<p>Purpose of test: See the test case description from the Test Harness.</p> <p>Equipment: HbbTV Test Harness.</p> <p>Test procedure: Run the test using the Test Harness. Follow the on-screen instructions.</p> <p>Expected result: PASS</p>	
<b>Test result(s)</b>	Test Harness returns PASS [OK] or FAIL [Fault], mark the result below.	
<b>Conformity</b>	<input type="checkbox"/> OK [PASS] <input type="checkbox"/> Fault [NOT OK]	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 16:60 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext (8:6)</b>	
<b>Section</b>	NorDig Unified 7.1.6	
<b>Requirement</b>	<p>For services that have both an EBU Teletext service and an HbbTV Digital Teletext application signaled and available, the NorDig Hybrid shall (1) be able to start and display the HbbTV Digital Teletext application as well as being able to start and display the EBU Teletext service (one at a time).</p> <p>The NorDig Hybrid shall (1) start teletext and be able to toggle between any HbbTV Digital Teletext and any EBU Teletext service as described in clause 5.3.4 of HbbTV specification ETSI TS 102 796.</p>	
<b>IRD Profile(s)</b>	Hybrid	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify that the IRD is able to start EBU Teletext and HbbTV Digital Teletext (one at the time). A transport stream containing a test services with EBU Teletext and HbbTV Digital Teletext application is required.</p> <p><b>Test procedure:</b> 1. Tune to a serve that contains both EBU Teletext and HbbTV Digital Teletext application. 2. Verify that the user can toggle between EBU Teletext and HbbTV Digital Teletext application by pressing the “text” button in the RCU.</p> <p><b>Expected result:</b> User can toggle between EBU Teletext and HbbTV Digital Teletext application.</p>	
<b>Test result(s)</b>	[OK] or FAIL [Fault], mark the result below.	
<b>Conformity</b>	<input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information	

<i>Date</i>		<i>Sign</i>	

<i>Test Case</i>	<b>Task 16:61 Subtitling - coexistent with HbbTV applications (8:7)</b>
<i>Section</i>	NorDig Unified 7.1.7
<i>Requirement</i>	<p>A NorDig Hybrid shall support simultaneous display of HbbTV application and subtitles (DVB subtitling and EBU teletext subtitling), both for broadcast and at least for MPEG2 TS delivered via broadband [29].</p> <p>The NorDig Hybrid shall display the HbbTV application over the subtitles as described in clause 10.1.1 of HbbTV specification ETSI TS 102 796 [30]. This means that if the video is up or down-converted, to other than full screen video, the subtitles shall either be rescaled/repositioned appropriately or not displayed at all.</p>
<i>IRD Profile(s)</i>	Hybrid
<i>Test procedure</i>	<p><b>Purpose of test:</b> To verify that DVB and EBU teletext subtitling can coexists with HbbTV applications.</p> <p>A transport stream containing a test service with DVB and EBU teletext composition subtitling component and at least one signaled service bound HbbTV application at the same channel.</p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. set the IRD to the autostart mode for the HbbTV services and ensure that subtitles are enabled</li> <li>2. search channels</li> <li>3. zap to a channel that contains the HbbTV service and subtitles</li> <li>4. verify that when the HbbTV application is not using the same graphics plane or area of the plane as the subtitles, the subtitles are visible</li> </ol> <p><b>Expected result:</b> The subtitles are visible with a HbbTV application, when they are not sharing the same area of the graphics plane.</p>
<i>Test result(s)</i>	[OK] or FAIL [Fault], mark the result below.
<i>Conformity</i>	<input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments
<i>Comments</i>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information
<i>Date</i>	<i>Sign</i>

<i>Test Case</i>	<b>Task 16:62 Remote Control Key event mapping for NorDig Hybrid (9:11)</b>
<i>Section</i>	NorDig 8.7.2.6
<i>Requirement</i>	The NorDig Hybrid IRD shall generate (HbbTV) events according to Table 8.3 when a key is pressed on the NorDig IRD remote control.
<i>IRD Profile(s)</i>	Hybrid
<i>Test procedure</i>	<p><b>Test procedure:</b> Check the manufacturer technical specification / compliance list or verify the remote control functions.</p> <p><b>Expected result:</b> The minimum hardware requirement is fulfilled.</p>
<i>Test result(s)</i>	[OK] or FAIL [Fault], mark the result below.

**NorDig**

<i>Conformity</i>	<input type="checkbox"/> <b>OK Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments		
<i>Comments</i>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information		
<i>Date</i>		<i>Sign</i>	

### 2.17 Task 17: User Preferences

<b>Test Case</b>	<b>Task 17:1 Stored preferences</b>	
<b>Section</b>	NorDig Unified 16.1 and 16.2	
<b>Requirement</b>	The user shall be able to store preference settings in persistent memory. All user preference settings listed below shall remain when changing service and when re-starting the IRD. The following user preferences shall be implemented in the NorDig IRD, unless it is stated below as optional (should) requirement. (See section 16.4 for factory default values).	
<b>IRD Profile(s)</b>	Basic, IRD, FE	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify stored user preferences</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[DVB-S/C/T Modulator]     B --- C[Up Converter]     C --- D[DVB Receiver]     D --- E[Monitor]     </pre> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>Verify following user preferences: <ul style="list-style-type: none"> <li>* Service list</li> <li>* Country settings</li> <li>* Talking menus/Text-to-speech</li> <li>* SSU settings</li> <li>* HbbTV settings</li> <li>* HDCP preferences (Optional)</li> <li>* Video display preferences</li> <li>* Audio preferences</li> <li>* Primary and secondary audio language preferences</li> <li>* Primary and secondary subtitling language preferences</li> <li>* Service list preferences</li> <li>* Country settings preferences</li> <li>* Audio transcoding preferences</li> <li>* HDMI preferences</li> <li>* Supplementary Audio settings</li> </ul> </li> </ol> <p><b>Expected result:</b> User preferences are as defined.</p>	
<b>Test result(s)</b>		
<b>Conformity</b>	<input type="checkbox"/> <b>OK</b> <input type="checkbox"/> <b>Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 17:2 Deletion of service lists</b>	
<b>Section</b>	NorDig Unified 16.3	
<b>Requirement</b>	The IRD shall provide a function to remove all service lists (default and user defined) and should not affecting other parameters (e.g. user preferences).	
<b>IRD Profile(s)</b>	Basic, IRD, FE	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify deletion of the service lists</p> <p><b>Equipment:</b></p>  <pre> graph LR     A[MPEG 2-source] --- B[Multiplex]     B --- C[DVB-S/C/T Modulator]     C --- D[Up Converter]     D --- E[DVB Receiver]     E --- F[Monitor] </pre> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Verify if the receiver supports a mechanism to only remove service lists.</li> <li>2. Verify that the service list(s) exists</li> <li>3. Remove service list(s)</li> <li>4. Verify remove of the service list(s)</li> </ol> <p><b>Expected result:</b> Service lists are removed.</p>	
<b>Test result(s)</b>		
<b>Conformity</b>	<input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments	
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information	
<b>Date</b>		<b>Sign</b>

<b>Test Case</b>	<b>Task 17:3 Reset to factory mode</b>	
<b>Section</b>	NorDig Unified 16.4	
<b>Requirement</b>	The IRD shall provide a function to reset all parameters to factory mode, thus removing all service lists, user preferences, etc. After reset, the IRD shall enter installation state.	
<b>IRD Profile(s)</b>	Basic, IRD, FE	
<b>Test procedure</b>	<p><b>Purpose of test:</b> To verify the reset function.</p> <p><b>Equipment:</b></p> <p><b>Test procedure:</b></p> <ol style="list-style-type: none"> <li>1. Locate the reset to factory mode function in the IRD and initiate it.</li> <li>2. Check that the service list and user preferences have been deleted.</li> <li>3. Enter the navigator and check that the factory mode meets the requirements.</li> <li>4. Fill in the test protocol.</li> </ol> <p><b>Expected result:</b> The IRD has the user preference settings according the requirements.</p>	
<b>Test result(s)</b>	Test protocol	

	<b>Requirement</b>	<b>Value</b>	<b>NOK or OK</b>
	RF input DC power supply source for satellite front-end:	on	
	RF input DC power supply source for terrestrial front-end:	off (1)	
	RF-output preset channel:	Channel 43 (PAL-G) (2)	
	RF bypass gain	Disabled	
	Menu language:	equal to country settings	
	Audio (normal)	On	
	Primary audio language:	equal to country settings	
	Audio format setting:	Stereo	
	Audio; hard of hearing/hearing impaired:	Off	
	Subtitling (normal):	on	
	Primary subtitling language:	as country settings	
	Subtitling; hard of hearing/hearing impaired:	off	
	HbbTV Interactivity	On	
	HDMI Audio output	Automatic using EDID information	
	HDMI Video output	Automatic using EDID information	
	HDCP	ON or as specified by the relevant network/ CA operator see section 9.11.4 (1)	
	SSU – mode	Semi-automatic (if supported, otherwise a mode that enables automatic search)	
	PVR recording priority, SD vs HD	HD	
	Talking menus (Text-to-Speech), optional	Off	
<b>Conformity</b>	<input type="checkbox"/> <b>OK Fault</b> <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments		
<b>Comments</b>	If possible describe if fault can be fixed with software update: <input type="checkbox"/> <b>YES</b> <input type="checkbox"/> <b>NO</b> Describe more specific faults and/or other information		
<b>Date</b>		<b>Sign</b>	

## AnnexA: NorDig Network Custodians

The NorDig Network Custodians are represented (per June 17th, 2008) by the following companies in the Nordic countries and relevant networks:
