

For information only

NorDig Test Plan spec. v. 3.1.1 markup version

This document illustrates difference between
NorDig Test Plan ver. 2.6.0 and ver. 3.1.1

**Yellow highlight marking marks changes in text compared to
NorDig Test Plan ver. 2.6.0**

NorDig Unified Test Plan for **Integrated Receiver Decoders**

for use in
cable, satellite, terrestrial and managed IPTV based networks

Version 3.1.1

Date: **03.09.2019**

| | |
|---|-----------|
| 1 Document History | 11 |
| 2 References | 13 |
| 3 Background | 13 |
| 4 NorDig compliance testing | 14 |
| 5 Test specifications for NorDig compliance | 14 |
| 6 Testing and test report for NorDig compliance | 15 |
| 6.1 Test item | 16 |
| 6.2 List of Abbreviations | 17 |
| 1 Introduction - Test Cases | 22 |
| 2 Test Plan for NorDig - Test Cases | 36 |
| 2.1 Task 1: Satellite tuner and demodulator | 36 |
| 2.1.1 QEF Quality Measurement Methods | 36 |
| 2.1.2 Test cases | 40 |
| Task 1:1 General | 40 |
| Task 1:2 General | 40 |
| Task 1:3 Quality reception detector | 41 |
| Task 1:4 Symbol and FEC-rate (DVB-S2) | 41 |
| Task 1:5 Input Frequency Range/Tuning range | 44 |
| Task 1:6 Tuning/ Scanning Procedures (with NIT) | 45 |
| Task 1:7 Tuning/ Scanning Procedures (without NIT) | 46 |
| Task 1:8 Control signals | 46 |
| Task 1:9 Demodulation (DVB-S2) | 47 |
| Task 1:10 RF Input Connector and Output Connector (option) | 50 |
| Task 1:11 Input Signal Level | 51 |
| Task 1:12 Power Supply and Control Signal (to RF unit) | 53 |
| Task 1:13 Power Supply and Control Signal (to single-channel RF unit) | 54 |
| Task 1:14 Performance: Digital interference | 55 |
| 2.2 Task 2: Cable Tuner and Demodulator | 58 |
| 2.2.1 QEF Quality Measurement Methods | 58 |
| 2.2.2 Test cases | 59 |
| Task 2:1 General | 59 |
| Task 2:2 General | 59 |
| Task 2:3 Quality reception detector | 60 |
| Task 2:4 RF Characteristics: Input frequency range and input level, Digital channels | 60 |
| Task 2:5 RF Characteristics: Symbol rate and modulation | 61 |
| Task 2:6 RF Characteristics: Input impedance | 62 |
| Task 2:7 RF bypass | 63 |
| Task 2:8 Tuning/Scanning procedure (Automatic scan based on NIT) | 64 |
| Task 2:9 Tuning/Scanning procedure (Manual scan) | 65 |
| Task 2:10 Tuning/Scanning procedure (Original_network_id, transport_stream_id and service_id triplet support) | 65 |
| Task 2:11 Tuning/Scanning procedure – Network default values | 66 |
| Task 2:12 Tuning/Scanning procedure – Factory default values | 67 |
| Task 2:13 Total input power | 68 |
| Task 2:14 RF Performance - C/N for Reference BER | 69 |
| Task 2:15 RF Performance - C/N with echo | 70 |
| Task 2:16 Performance Data: Noise figure | 72 |
| Task 2:17 RF Performance - Image Channel | 74 |
| Task 2:18 RF Performance – Digital Adjacent Channel | 75 |
| Task 2:19 RF Performance – Analog Adjacent Channel | 76 |
| Task 2:20 LO leakage | 78 |
| Task 2:21 Spurious emission | 78 |
| Task 2:22 Radiation | 79 |
| 2.3 Task 3: Terrestrial Tuner and Demodulator | 80 |
| 2.3.1 Test equipment summary | 80 |
| 2.3.2 QEF Quality Measurement Methods | 80 |

| | |
|---|-----|
| 2.3.3 Bitrates | 93 |
| 2.3.4 Receiver operability in SFN | 94 |
| 2.3.5 0dB echo | 95 |
| 2.3.6 Conditions for analogue TV | 95 |
| 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks | 96 |
| 2.3.8 Stream packet structure in Receiver Buffer Model (RBM) tests for DVB-T2 | 103 |
| 2.3.9 Test cases | 104 |
| 2.3.9.1 Test cases – DVB-T IRD | 104 |
| Task 3:1 General | 104 |
| Task 3:2 General | 104 |
| Task 3:3 Quality reception detector | 105 |
| Task 3:4 Frequencies: Center frequencies | 105 |
| Task 3:5 Frequencies: Frequency offset | 109 |
| Task 3:6 Frequencies: Signal bandwidths | 110 |
| Task 3:7 Modes | 112 |
| Task 3:8 Tuning/Scanning Procedure: General | 113 |
| Task 3:9 Tuning/Scanning Procedures: Basic status check | 114 |
| Task 3:10 Tuning/Scanning Procedures: Automatic channel search for the same service bouquet | 115 |
| Task 3:11 Tuning/Scanning: Automatic channel search for different service bouquets | 120 |
| Task 3:12 Tuning/Scanning Procedures: Manual Channel Search | 122 |
| Task 3:13 Verification of Signal Strength Indicator (SSI) | 124 |
| Task 3:14 Verification of Signal Quality Indicator (SQI) | 127 |
| Task 3:15 Changes In Modulation Parameters | 130 |
| Task 3:16 RF input connector | 132 |
| Task 3:17 RF output connector | 133 |
| Task 3:18 Performance: BER vs C/N verification | 134 |
| Task 3:19 Performance: C/N performance on Gaussian channel | 136 |
| Task 3:20 Performance: C/N performance on 0dB echo channel | 139 |
| Task 3:21 Performance: Minimum receiver signal input levels on Gaussian channel | 140 |
| Task 3:22 Performance: Minimum IRD Signal Input Levels on 0dB echo channel | 142 |
| Task 3:23 Performance: Noise figure on Gaussian channel | 145 |
| Task 3:24 Performance: Maximum Receiver Signal Input Levels | 147 |
| Task 3:25 Performance: Immunity to “digital” signals in Other Channels | 148 |
| Task 3:26 Performance: Immunity to “LTE 700 MHz” signals in Other Channels | 151 |
| Task 3:27 Performance: Immunity to “LTE 800 MHz” signals in Other Channels | 153 |
| Task 3:28 Performance: Performance in Time-Varying Channels | 155 |
| Task 3:29 Performance: Synchronisation for varying echo power levels in SFN | 157 |
| Task 3:30 Performance: C/(N+I) Performance in SFN for more than one echo | 159 |
| Task 3:31 Performance: C/(N+I) Performance in SFN inside the guard interval | 162 |
| Task 3:32 Performance: C/(N+I) Performance in SFN outside the guard interval | 169 |
| 2.3.9.2 Test cases – DVB-T2 | 171 |
| Task 3:33 DVB-T2: Frequencies: Center frequencies | 171 |
| Task 3:34 DVB-T2: Frequencies: Frequency offset | 175 |
| Task 3:35 DVB-T2: Frequencies: Signal bandwidths | 177 |
| Task 3:36 DVB-T2: Modes | 179 |
| Task 3:37 DVB-T2: MISO | 182 |
| Task 3:38 DVB-T2: Input Mode B (multiple PLPs) | 185 |
| Task 3:39 DVB-T2: Input Mode B (multiple PLPs and common PLP) | 186 |
| Task 3:40 DVB-T2: Input Mode B (RBM for TDI) | 187 |
| Task 3:41 DVB-T2: Input Mode B (RBM for DJB) | 188 |
| Task 3:42 DVB-T2: Input Mode B (RBM when FEF present) | 190 |
| Task 3:43 DVB-T2: Normal mode (NM) | 192 |
| Task 3:44 DVB-T2: Input Mode A (zero power FEF present) | 193 |
| Task 3:45 DVB-T2: Input Mode A (RBM when FEF present) | 195 |
| Task 3:46 DVB-T2: Auxiliary streams | 196 |
| Task 3:47 DVB-T2: Reception of version 1.1.1 | 198 |

| | |
|---|------------|
| Task 3:48 DVB-T2: Tuning/Scanning Procedures: Automatic channel search for the same service bouquet | 199 |
| Task 3:49 DVB-T2: Tuning/Scanning Procedures: Basic status check | 204 |
| Task 3:50 DVB-T2: Verification of Signal Strength Indicator (SSI) | 205 |
| Task 3:51 DVB-T2: Verification of Signal Quality Indicator (SQI) | 208 |
| Task 3:52 DVB-T2: Changes In Modulation Parameters | 212 |
| Task 3:53 DVB-T2: Time interleaving | 213 |
| Task 3:54 DVB-T2: Input/Output Data Formats | 215 |
| Task 3:55 DVB-T2: Performance: BER vs C/N verification | 216 |
| Task 3:56 DVB-T2: Performance: C/N performance on Gaussian channel..... | 217 |
| Task 3:57 DVB-T2: Performance: C/N performance on 0dB echo channel | 220 |
| Task 3:58 DVB-T2: Performance: Minimum receiver signal input levels on Gaussian channel..... | 221 |
| Task 3:59 DVB-T2: Performance: Minimum IRD Signal Input Levels on 0dB echo channel..... | 225 |
| Task 3:60 DVB-T2: Performance: Receiver noise figure on Gaussian channel | 227 |
| Task 3:61 DVB-T2: Performance: Maximum Receiver Signal Input Levels | 229 |
| Task 3:62 DVB-T2: Performance: Immunity to “digital” signals in Other Channels | 230 |
| Task 3:63 DVB-T2: Performance: Immunity to “LTE 700 MHz” signals in Other Channels | 234 |
| Task 3:64 DVB-T2: Performance: Immunity to “LTE 800 MHz” signals in Other Channels | 236 |
| Task 3:65 DVB-T2: Performance: Performance in Time-Varying Channels | 238 |
| Task 3:66 DVB-T2: Performance: Synchronisation for varying echo power levels in SFN | 241 |
| Task 3:67 DVB-T2: Performance: C/(N+I) Performance in SFN for more than one echo..... | 243 |
| Task 3:68 DVB-T2: Performance: C/(N+I) Performance in SFN inside the guard interval | 247 |
| Task 3:69 DVB-T2: Performance: C/(N+I) Performance in SFN outside the guard interval | 254 |
| 2.4 Task 4: IP-Based Front-end..... | 258 |
| 2.5 Task 5: MPEG2 demultiplexer | 259 |
| Task 5:1 SI utilization | 259 |
| Task 5:2 CA descriptor interpretation | 259 |
| Task 5:3 Maximum transport stream data rate | 259 |
| Task 5:4 Number of elementary streams | 260 |
| Task 5:5 Section filtering..... | 261 |
| Task 5:6 Variable Bitrate Elementary Streams..... | 262 |
| Task 5:7 Mixture of SD and HD services types..... | 262 |
| Task 5:8 Descrambler Performance | 264 |
| Task 5:9 System clock recovery | 264 |
| 2.6 Task 6: Video | 266 |
| Task 6:1 Video Decoder - General..... | 266 |
| Task 6:3 Video resolution scaling Up-sampling/Up-conversion | 271 |
| Task 6:4 Video Decoder - Colorimetry | 276 |
| Task 6:5 Video Decoder - Dynamic changes in video stream..... | 278 |
| Task 6:6 Video Decoder - AVC still picture | 282 |
| Task 6:6 MPEG-2 Minimum video bandwidth..... | 283 |
| Task 6:7 Frame cropping | 285 |
| Task 6:8 Overscan..... | 286 |
| Task 6:9 High Definition Video Output and Display..... | 287 |
| Task 6:10 Down-conversion of High Definition Video for Standard Definition outputRestrictions on analogue video output..... | 288 |
| Task 6:12 16:9 displayed on 4:3 monitors<REMOVED TEST CASE> | 288 |
| Task 6:11 Displaying of 4:3 Material on 16:9 Monitors | 290 |
| Task 6:12 Rescaling for HbbTV application | 291 |
| Task 6:13 Dynamic update of PMT- Component priority Video (stream type)<Task moved from SI section to Video Test Tasks> | 291 |
| 2.7 Task 7: Audio | 294 |
| Task 7:1 Audio User Preference Settings..... | 294 |
| Task 7:2 MPEG-1 Layer II: Requirements..... | 294 |
| Task 7:3 MPEG-1 Layer II: Analogue audio output..... | 295 |
| Task 7:4 MPEG-1 Layer II: HDMI output interface..... | 296 |
| Task 7:5 MPEG-1 Layer II: S/PDIF output interface | 297 |
| Task 7:6 AC-3: Requirements..... | 298 |

| | |
|---|------------|
| Task 7:7 AC-3: Analogue audio output..... | 299 |
| Task 7:8 AC-3: HDMI output and HDMI ARC interface..... | 300 |
| Task 7:9 AC-3: S/PDIF output interface..... | 301 |
| Task 7:10 AC-3: Metadata..... | 303 |
| Task 7:11 E-AC-3: Requirements..... | 303 |
| Task 7:12 E-AC-3: Analogue audio output..... | 304 |
| Task 7:13 E-AC-3: required output formats for HDMI output and HDMI ARC interface and HDMI eARC..... | 306 |
| Task 7:14 E-AC-3: S/PDIF output interface..... | 307 |
| Task 7:15 E-AC-3: Metadata..... | 308 |
| Task 7:16 HE AAC: Requirements..... | 309 |
| Task 7:17 HE AAC: Analogue audio output..... | 311 |
| Task 7:18 HE AAC: required output formats for HDMI output, and HDMI ARC interface and HDMI eARC..... | 312 |
| Task 7:19 HE AAC: S/PDIF output interface..... | 314 |
| Task 7:20 HE AAC: Metadata..... | 315 |
| Task 7:21 Audio prioritizing for non-NGA streams - Audio language support..... | 316 |
| Task 7:22 Audio Prioritising for non-NGA streams – audio format and stream type..... | 317 |
| Task 7:23 Audio Prioritising for non-NGA streams – audio type..... | 320 |
| Task 7:24 Audio Prioritising for non-NGA streams – audio format signaling missing..... | 322 |
| Task 7:25 Audio video synchronization..... | 323 |
| Task 7:26 Adjustment of Video/audio-delay..... | 325 |
| Task 7:27 Audio handling when changing service or audio format..... | 326 |
| Task 7:28 Dynamic changes in audio components..... | 327 |
| Task 7:29 Dynamic update of PMT- Component priority (stream type)..... | 328 |
| Task 7:30 Audio descriptors..... | 331 |
| Task 7:31 Supplementary audio..... | 332 |
| Task 7:32 IRD Internal Reference Level..... | 333 |
| Task 7:33 Loudness levels - Audio Output Levels..... | 334 |
| Task 7:34 AC-4: Requirements..... | 336 |
| Task 7:35 AC-4: Analogue audio output..... | 337 |
| Task 7:36 AC-4: required output formats for HDMI, HDMI ARC and HDMI eARC..... | 338 |
| Task 7:37 AC-4: recommended output formats for HDMI and HDMI eARC only (optional)..... | 340 |
| Task 7:38 AC-4: recommended output formats for HDMI ARC (optional)..... | 341 |
| Task 7:39 AC-4: required output formats for S/PDIF..... | 342 |
| Task 7:40 Dialogue Enhancement..... | 343 |
| Task 7:41 Automatic Audio PID/Stream prioritisation for NGA capable NorDig HEVC IRDs..... | 344 |
| Task 7:42 Automatic Audio PID/Stream prioritisation for NGA capable NorDig HEVC IRDs..... | 346 |
| Task 7:43 Automatic Audio Prioritisation inside the NGA Audio PID/stream..... | 347 |
| Task 7:44 Manual Audio PID/Stream selection for NorDig IRDs..... | 350 |
| Task 7:45 Manual selection of audio preselection based on information from the Audio Preselection Descriptor..... | 352 |
| Task 7:46 Audio Prioritisation inside the NGA Audio PID/stream based on information from elementary stream..... | 354 |
| 2.8 Task 8: Teletext and subtitling..... | 357 |
| Task 8:1 Subtitling - user preferences..... | 358 |
| Task 8:2 Subtitling - Only display subtitling if match language in user preferences..... | 359 |
| Task 8:3 Subtitling - Temporary changes to subtitling settings..... | 361 |
| Task 8:4 Subtitling – Subtitling mode (Normal and Hard of hearing subtitling)..... | 363 |
| Task 8:5 Subtitling – DVB Subtitling and sSubtitling priority (TTML/DVB/EBU)..... | 365 |
| Task 8:6 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext..... | 369 |
| Task 8:7 Subtitling - Simultaneous Subtitling and coexistent with HbbTV applications..... | 370 |
| Task 8:8 EBU Teletext – EBU Teletext General (level 1.5)..... | 371 |
| Task 8:9 EBU Teletext - - Additional requirements for Analogue video Interface decoding method(VBI)..... | 372 |
| Task 8:10 Teletext decoding method(OSD)..... | 373 |
| Task 8:11 EBU Teletext – teletext pages..... | 374 |
| Task 8:12 EBU Teletext – teletext pages - cache..... | 376 |

| | |
|--|------------|
| Task 8:13 Subtitling – EBU Teletext subtitling | 377 |
| Task 8:14 DVB Subtitling and – DVB Subtitling subset | 379 |
| Task 8:15 TTML Subtitling | 383 |
| 2.9 Task 9: Interfaces and Signal Levels | 386 |
| Task 9:1 Two-way Interface | 386 |
| Task 9:2 SCART Interface (option) | 386 |
| Task 9:3 HDMI interface – HD Ready (High Definition Multimedia Interface) | 387 |
| Task 9:4 Video output format selection from HDMI interface E-EDID information | 388 |
| Task 9:5 Audio output format selection from HDMI E-EDID information | 389 |
| Task 9:6 Audio format selection from HDMI ARC CEC messages | 390 |
| Task 9:7 Audio output format selection from HDMI eARC CDS information | 391 |
| Task 9:8 HDMI interface – Original format | 392 |
| Task 9:9 HDMI – Manual setting for resolution | 393 |
| Task 9:10 HDMI – Signal protection for STBs (HDMI output) | 395 |
| Task 9:11 Analogue video interface output resolution (Option) | 399 |
| Task 9:12 Remote User Control Function Keys | 400 |
| Task 9:13 Remote User Control Function Keys for PVR | 402 |
| Task 9:14 Remote User Control Key Function event mapping for NorDig Hybrid HbbTV | 402 |
| 2.10 Task 10: Interfaces for Conditional Access | 404 |
| Task 10:1 Use of Common Interface | 404 |
| Task 10:2 Smart Card Interface | 404 |
| 2.11 Task 11: The System Software Update | 405 |
| 2.11.1 SSU testing General | 405 |
| 2.11.2 Test equipment summary | 406 |
| 2.11.2.1 Broadcast SSU (OTA) | 406 |
| 2.11.2.2 Network SSU | 408 |
| 2.11.3 Test cases | 408 |
| Task 11:1 IRD System software update using DVB SSU simple profile | 408 |
| Task 11:2 IRD System software update using DVB SSU enhanced profile - scheduling | 411 |
| Task 11:3 IRD System software update using DVB SSU Notification | 415 |
| Task 11:4 IRD System software update using over-the-network download | 417 |
| Task 11:5 IRD System software update using USB update | 420 |
| Task 11:6 SSU end user functionality | 422 |
| Task 11:7 Common interface plus (CI+) CAM module system software update | 424 |
| 2.12 Task 12: Performance | 424 |
| Task 12:1 Video performance | 424 |
| Task 12:2 Audio performance | 425 |
| Task 12:3 Zapping time | 426 |
| 2.13 Task 13: Service Information | 429 |
| 2.13.1 General | 429 |
| Task 13:1 SI: General | 429 |
| Task 13:2 SI: General – Undefined data structures | 429 |
| Task 13:3 SI: General – ‘Actual’ and ‘Other’ tables | 430 |
| Task 13:4 SI: SI data available through an API (HbbTV) | 430 |
| Task 13:5 SI: Text strings and field size of the SI descriptor | 430 |
| 2.13.2 Static PSI/SI data | 432 |
| Task 13:6 NIT_actual – frequency_list_descriptor | 432 |
| Task 13:7 NIT_actual – Missing terrestrial_system_delivery_descriptor | 434 |
| Task 13:8 NIT_actual – Missing T2_delivery_system_descriptor | 435 |
| Task 13:9 SDT_actual service_descriptor and CA_identifier_descriptor | 437 |
| 2.13.3 Quasi static PSI/SI data | 438 |
| Task 13:10 Quasi static update of SDT_actual | 438 |
| Task 13:11 Quasi-static update of SDT_actual – linkage to NorDig simulcast replacement service | 440 |
| Task 13:12 Quasi-static update of NIT_actual – Linkage to an information service about the network | 443 |
| Task 13:13 Quasi-static update of NIT_actual – Linkage to EPG service | 443 |
| Task 13:14 Quasi-static update of NIT_actual – Linkage to TS that carries EIT sch information for all services | 445 |
| Task 13:15 Quasi-static update of NIT_actual – Linkage to System Software Download service | 446 |

| | |
|---|------------|
| 2.13.4 Dynamic PSI/SI data..... | 446 |
| Task 13:16 Dynamic update of SDT_actual running status and linkage to a service replacement service | 446 |
| Task 13:17 Dynamic update of EIT actual/other p/f for short_event_descriptor and extended_event_descriptor | 448 |
| Task 13:18 Dynamic update of EIT data_actual p/f CA_identifier_descriptor (optional) | 452 |
| Task 13:19 Dynamic update of EIT actual/ other p/f short_event_descriptor, extended_event_descriptor and content_descriptor of Multiple languages in EIT data | 453 |
| Task 13:20 Dynamic update of EIT actual/other p/f content descriptor and component_descriptor | 456 |
| Task 13:21 Dynamic update of EIT actual/other p/f parental_rating_descriptor | 458 |
| Task 13:22 Dynamic update of EIT actual/other p/f and schedule in ESG using linkage 0x04 to EIT schedule (EIT in Barker channel) | 461 |
| Task 13:23 Dynamic update of EIT actual/other p/f and schedule in ESG (cross carried EIT schedule in all TSs) | 466 |
| Task 13:24 PMT Descriptors - General | 470 |
| Task 13:25 PMT Descriptors – teletext pages, teletext subtitling and DVB subtitling | 473 |
| Task 13:25 Dynamic update of PMT PID values | 473 |
| Task 13:26 Dynamic update of PMT-Component priority (stream type) | 474 |
| Task 13:27 Dynamic update of PMT – Content Protection descriptor | 477 |
| Task 13:27 Dynamic update of TDT/TOT | 477 |
| Task 13:28 Audio Preselection Descriptor (Optional) | 481 |
| 2.14 Task 14: Navigator | 484 |
| 2.14.1 General | 484 |
| Task 14:1 Navigator: General | 484 |
| Task 14:2 User Information about service components – Audio and Subtitling | 485 |
| 2.14.2 Static PSI/SI data | 485 |
| Task 14:3 Service list - General requirement | 485 |
| Task 14:4 Service list – service types and categories | 487 |
| Task 14:5 Service list – use of NIT_other and SDT_other | 490 |
| Task 14:6 Service list - Inconsistent of SDT_actual and NIT_actual information | 492 |
| Task 14:7 Service list – NIT_actual interpretation | 493 |
| Task 14:8 Service list – NIT_actual test transmissions original_network_ID | 495 |
| Task 14:9 Service list – NIT_actual test transmission network_ID | 496 |
| Task 14:10 Service list – Inconsistent SDT_actual/NIT_actual and SDT_other/NIT_other | 498 |
| Task 14:11 Service list – Handling of multiple channel lists from same networks and NorDig LCD | 499 |
| Task 14:12 Service list – Simultaneous transmission of LCD v1 and v2 | 502 |
| Task 14:13 Service list – Simultaneous reception of multiple networks and NorDig LCD | 504 |
| Task 14:14 Service list - Priority of LCN between SD and HDTV services | 506 |
| Task 14:15 Service list – Component descriptor | 509 |
| 2.14.3 Quasi static PSI/SI data | 511 |
| Task 14:16 Quasi-static update of service list – service added addition | 511 |
| Task 14:17 Quasi-static update of service list – non-visible data service added addition | 514 |
| Task 14:18 Quasi-static update of service list – services moved between different transport streams ... | 516 |
| Task 14:19 Quasi-static update of service list – service remove | 518 |
| Task 14:20 Quasi-static update of service list from NIT_actual for non-existing multiplexers/transport streams | 521 |
| Task 14:21 Quasi-static update of service list from NIT_actual for removing a multiplex | 523 |
| Task 14:22 Quasi-static update of NorDig LCN v1 | 525 |
| Task 14:23 Quasi-static update of NorDig LCN v2 | 529 |
| 2.15 Task 15: PVR Functionality | 533 |
| Task 15:1 Recording File System | 533 |
| Task 15:2 Recording capacity | 533 |
| Task 15:3 Deletion of the recordings | 534 |
| Task 15:4 Failed and incomplete recordings | 534 |
| Task 15:5 File system intact after update | 535 |
| Task 15:6 Limitations in recorded content – no extraction | 536 |
| Task 15:7 Limitations in recorded content – downscaling of the HD content to the removable media .. | 537 |
| Task 15:8 Disk Management | 537 |

| | |
|---|------------|
| Task 15:9 General PVR recording – bitrates | 538 |
| Task 15:10 General PVR recording – service types | 539 |

Part I – Introduction

1 Document History

| Version | Date | Comments |
|------------|---------|---|
| Ver 1.0 | 11.2004 | This is the first approved version of the complete NorDig Unified Test specification |
| Ver. 1.0.3 | 03.2007 | This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 1.0.3 |
| Ver 2.0 | 06.2008 | This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 2.0. It also reflects that the NorDig logo is no more offered. |
| Ver. 2.2.1 | 01.2012 | This is the updated version of the complete NorDig Unified Test specification. This release is compliant with the NorDig Unified specification ver. 2.2.1. |
| Ver. 2.2.2 | 11.2012 | This is the updated version of the complete NorDig Unified Test specification. This release updated some DVB-S, DVB-T/T2 and PVR test cases. This release is compliant with the NorDig Unified specification ver. 2.2.1. |
| Ver 2.4 | 10.2013 | This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.4. Main changes in this release are: <ul style="list-style-type: none"> • Change of document name from “test specification” to “test plan” • LTE interferer for DVB-T and DVB-T2 • Test cases for RBM in case of reception of DVB-T2 signals. Tests are based on DVB V&V work and harmonized with Ebook and Dbook. • Change of DVB-T2 version from 1.1.1 to 1.2.1 • Reception of DVB-T2 v1.1.1 signals • Video, Audio and Subtitling test case updates due removing M2 and M4 requirements. • MHP related test cases removed |
| Ver 2.5.0 | 01.2016 | This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.5.1. Main changes in this release are: <ul style="list-style-type: none"> • Test case and chapter numbering changed • Test cases for DVB-T and T2 SSI updated • Test cases for DVB-C updated • Test cases for PVR updated • Test cases for Audio and Video updated |
| Ver 2.6.0 | 10.2017 | This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 2.6.0. Main changes in this release are: <ul style="list-style-type: none"> • Test cases for DVB-T/T2 for Analog interference removed • Test cases for DVB-T/T2 for LTE interference 800 MHz updated and for LTE 700 MHz added |

| | | |
|------------|------------|--|
| | | <ul style="list-style-type: none"> • Test cases for IRD System Software and API added • Test cases for DVB-T/T2 channel search updated • Test cases for DVB-SSU updated • Some test cases for PVR functionality updated |
| Ver. 3.1.1 | 03.09.2019 | <p>This is the updated version of the complete NorDig Unified Test plan. This release is compliant with the NorDig Unified specification ver. 3.1.1.</p> <p>The NorDig Test Plan ver. 3.1.1 is a major revision to be compliant to NorDig Unified IRD specification ver. 3.1.1, where the main changes are inclusion of HEVC video, NGA AC-4 audio and IRD system software update.</p> |

2 References

This test specification is related to the following documents:

- [1] NorDig Unified Requirements for Integrated Receiver Decoders, Version 3.1.1, September 2019 ~~October 2018.~~
- [2] NorDig Rules of Operation for NorDig Unified receiver networks, ver. 2.5 October 2016.
- [3] HbbTV Test Suite, the most recent released version published by HbbTV applicable to IRD implementing. The most recent released version published by HbbTV refers here to the latest version that was available up to 9 month before the IRD is released/launched, in order to give manufacture time for their QA verification and test process. (Note, HbbTV organisation normally only keep latest version available and at time of writing the latest version is 9.2.0)

3 Background

The NorDig group represents broadcasters and network operators in the Nordic countries **and Ireland**. The members have agreed on common minimum decoder specifications and a migration plan towards the use of decoders that satisfy these requirements. For further info about NorDig, please see www.nordig.org.

The various members of NorDig are independent of each other, but intend to transmit to IRDs that satisfy the specified common minimum requirements. The various networks may in addition specify network specific requirements.

Common test specifications are established in order to ensure that decoders comply with the common minimum requirements. Additional test specifications may apply for individual networks, especially networks with access-controlled transmissions.

The NorDig specifications are contained in the NorDig Unified specification [1] which covers and includes the following profiles; NorDig Basic and NorDig **HbbTV**. Figure 1 illustrate the relationships between the various NorDig profiles - **variants and capability**.

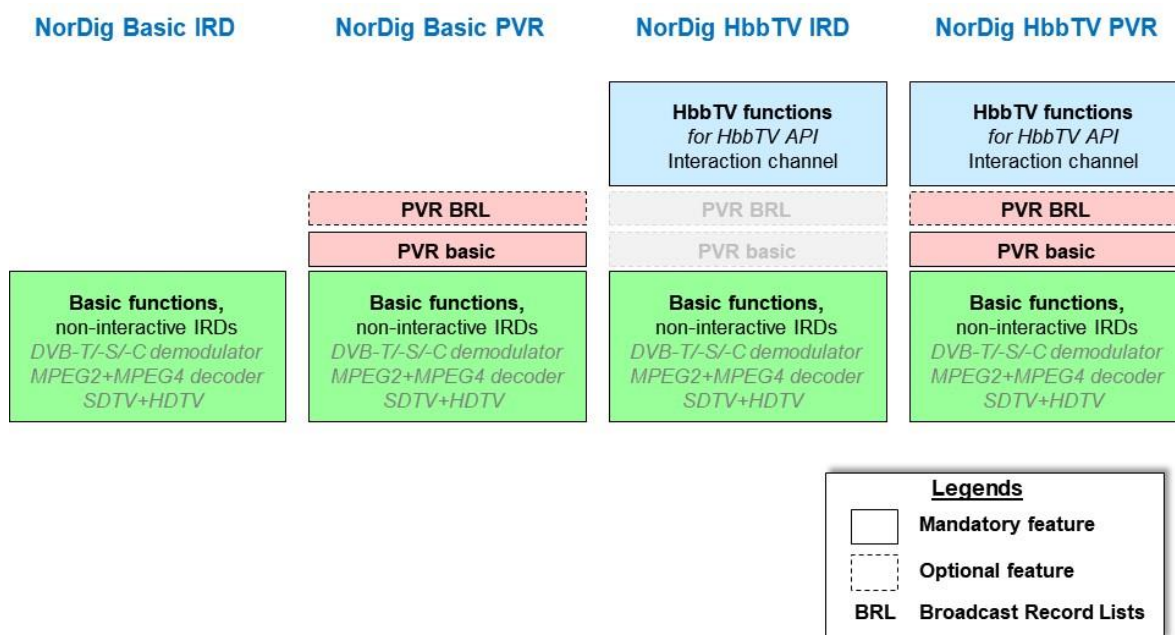

Figure 1 The NorDig profiles and the main building blocks.

4 NorDig compliance testing

The NorDig Verification Test is open for all IRD manufacturers that want to claim that they have IRD products that comply with the NorDig IRD requirements. The IRD manufacturer can claim compliance with one or more NorDig profile(s), provided that

- the IRD product complies with the NorDig profile(s)[1] referred to and,
- the IRD product passes the tests specified in this document.

The NorDig Verification Test shall ensure compliance with the NorDig requirements and NorDig transmissions, and comes in addition to the regular factory testing for general quality and functionality control.

In addition to the common NorDig requirements, the IRD-product has to comply with additional requirements and pass additional tests in case it is intended for use in a network that provides access controlled services. The additional requirements and tests will be available from the relevant Network Custodian.

The IRD Manufacturer shall furthermore contact the relevant Network Custodian(s) in case the IRD product shall be verified for networks with access controlled services. The relevant Network Custodian(s) will provide Network specific requirements (additional to the specified Unified NorDig Requirements) and the corresponding test specifications. Such further handling has to be agreed between the IRD Manufacturer and the relevant Network Custodian (Annex A).

5 Test specifications for NorDig compliance

The NorDig Unified test plan consists of test cases and the defined test procedures in each test case are only illustrations of the test setup and the manufacturer can use different setup to run the test cases. If other, than illustrated, test setup is used the manufactures shall describe used test setup in the test report. The defined test sets may not cover all NorDig Unified Requirements [1].

If any requirement in this test specification is in contradictory with the requirement in the specification [1], the requirement in specification [1] is the valid one.

6 Testing and test report for NorDig compliance

A Test Report should be made available to show compliance with the common NorDig requirements. Each individual test case should be performed; test results and conformity should be reported and signed.

In each test task a IRD profile is given. This means for which type of receiver the test task is relevant to perform. Following table specifies the abbreviations.

| IRD profile | Test task is dedicated for type receiver IRD |
|----------------------------|---|
| IRD | IRD (Integrated Receiver Decoder) is either IDTV or STB. IRD is used for requirements that are applicable for all types of IRDs (STB, iDTV, basic, HEVC, PVR, HbbTV IRDs...) <in v2.6 word Basic was used for this> |
| iDTV | IRD type is either IDTV, CarTV/in-vehicle-TV or PCTV |
| STB | IRD is a STB type without display and output the decoded selected service to an external display via a video and audio interface (e.g. HDMI). |
| Basic | IRD implements NorDig Basic or NorDig Hybrid profile without any optional capabilities (i.e. without HEVC, HbbTV or PVR capability) |
| HEVC | IRD implements NorDig HEVC capability (i.e. HEVC, NGA and TTML) |
| Hybrid HbbTV | IRD implements NorDig Hybrid profile HbbTV capability (observe, HbbTV mandatory for NorDig HEVC iDTVs). |
| PVR | IRD implements NorDig PVR functionality capability |
| all FE all IRDs | IRD implement at least one of the following front-ends: terrestrial, cable, satellite or DVB-S2X satellite DVB-T, DVB-T2, DVB-C, DVB-S or DVB-S2 (i.e. test applicatble for all kind of FrontEnds). |
| Cable DVB-C | IRD with cable DVB-C tuner supporting DVB-C |
| Satellite DVB-S | IRD with satellite DVB-S tuner supporting DVB-S and DVB-S2 |
| DVB-S2X | IRD with satellite DVB-S2 tuner supporting the optional DVB-S2X |
| Terrestrial | IRD with terrestrial DVB-T tuner supporting DVB-T and DVB-T2 |
| DVB-T | |
| DVB-T2 | IRD with DVB-T2 tuner |
| IPTV | IP based front-end (for managed IPTV networks) |

Wording used in IRD profiles / variant and capability for each test task:

Variants:

- IRD, STB, iDTV (where IRD is STB and iDTV)
- all IRDs, Terrestrial, Cable, Satellite, IPTV.

Capability:

- HEVC, PVR, HbbTV, S2X

Example for audio test Tasks:

- all IRDs
- HEVC IRD
- iDTV, HEVC iDTV, STB and HEVC STB
- iDTV, HEVC iDTV, STB or HEVC STB (so if a test is only for HEVC STB then HEVC STB, if the test is for both STB types then just STB and inside test write which parts is only applicable for HEVC STB).

Wording "variant and profile" Test tasks:

Example 1, (video): all IRDs

Example 2, (satellite): satellite IRD

Example 3, (video AVC+HEVC): all IRDs (then inside test cases mark if certain steps is applicable for e.g. HEVC)

Example 4, (video only HEVC): HEVC IRD

Example 5, (IRD where options other than NorDig capabilities, e.g. eARC): IRD with the option eARC

IRD variants and capability:

all IRDs
iDTV
STB
Terrestrial IRD
Cable IRD
Satellite IRD
IPTV IRD
HbbTV IRD
PVR IRD
supporting the optional S2X
iDTV with option for HDMI ARC
iDTV with option for HDMI eARC
all IRDs with optional analogue CVBS video output
all IRDs using OTA SSU simple profile
all IRDs using OTA SSU enhanced profile
all IRDs using DVB SSU Notification profile
all IRDs using OTN SSU profile
all IRDs using OTN and/or USB SSU profile
HEVC IRD supporting Audio Preselection Descriptor

Example of changed wording from NorDig Test Plan v2.6 to NorDig Test Plan v3.1:

Task 1:1: IRD ~~Profile(s)~~ variants and capability: ~~Basic, IRD, DVB-S, DVB-S2~~ Satellite IRD

In case that the test result indicates a non-compliance (with the specified requirement) the level of the non-compliance shall be evaluated and indicated by ticking the corresponding “box” in the conformity field. If such non-compliance can be removed by an upgrade of the IRD software, this shall be indicated by ticking the correct commentary field for the individual test. The manufacturer should describe the non-compliance and plans to correct it in the “Comments “ row.

The Information specified for the "Test item" should be provided, see section 6.1.

6.1 Test item

The information of the Test Item shall be inserted to the following table. The tests shall be performed with the same IRD model (HW/SW) in all test cases.

Table 6.1 Test Item

| Test Item | |
|---------------|--|
| Manufacturer: | |
| Model: | |
| S/N(s): | |
| SW version: | |
| HW version: | |
| Front-End: | |
| Demux: | |
| Processor: | |
| Memory size: | |

| | |
|------------------------------------|--|
| NorDig IRD Profile(s): | |
| Other relevant information: | |

Following information shall be entered to Table 6.1:

| | |
|------------------------------------|--|
| Manufacturer: | The name of the manufacturer of the tested IRD |
| Model: | The model (to be deployed to NorDig market) of the tested IRD |
| S/N(s): | The serial numbers of all IRDs which are used in the tests |
| SW version: | The SW version of the tested IRD model |
| HW version: | The HW version of the tested IRD model |
| Front-End: | The front-end type and model of the tested IRD |
| Demux: | The Demux type and model of the tested IRD |
| Processor: | The Processor type and model of the tested IRD |
| Memory size: | The memory size of the tested IRD |
| NorDig Profile | The NorDig profile of the tested IRD |
| Other relevant information: | The other relevant information that the IRD manufacturer feels important |

6.2 List of Abbreviations

| | |
|----------|--|
| 0b | values written in binary (ie with base 2) |
| 0x | values written in hexadecimal (ie with base 16) |
| AAC | Advanced Audio Codec |
| AAC-LC | Advanced Audio Codec Low Complexity |
| AC-3 | Audio Codec 3 |
| ACE | Active Constellation Extension |
| AFC | Automatic Frequency Control |
| AFD | Active Format Descriptor |
| AFNOR | Association Francaise de Normalisation |
| API | Application Programming Interface |
| ARC | Audio Return Channel (regarding HDMI interface) |
| AV | Audio (and) Video |
| BAT | Bouquet Association Table |
| BCD | Binary Coded Decimal |
| BDR | Broadcast Discovery Record (part of SD&S) |
| BER | Bit Error Ratio |
| BOOTP | Bootstrap Protocol |
| bslbf | bit string, left bit first |
| C/N | Carrier to Noise ratio |
| CA | Conditional Access |
| CAM | Conditional Access Module |
| CAT | Conditional Access Table |
| CATV | Community Antenna Television |
| CEA | Consumer Electronics Association (North American Association) |
| CENELEC | Comité Européen de Normalisation Electrotechnique |
| CI | Common Interface |
| CID | Content Identifier descriptor |
| CIF | Common Intermediate Format |
| CIP- CAM | CA-module that complies with the Common Interface Plus specification |
| CRC | Cyclic Redundancy Check |
| CRID | Content Reference Identifier |
| CSO | Composite Second Order |
| CTB | Composite Triple Beat |
| CVBS | Composite Video Baseband Signal |

| | |
|----------|--|
| D/A | Digital-to-Analogue converter |
| DAD | Default Authority Descriptor |
| DAVIC | Digital Audio-Visual Council |
| dB | decibel |
| dBFS | dB (relative to) Full Scale |
| DDS | Display definition segment |
| DDWG | Digital Display Working Group |
| DECT | Digital Enhanced Cordless Telecommunications |
| DHCP | Dynamic Host Configuration Protocol |
| DSB | Double SideBand |
| DSM-CC | Digital Storage Media Command and Control |
| DTS | Digital Theater System (audio codec) |
| DVB | Digital Video Broadcasting |
| DVB-C | Digital Video Broadcasting – Cable |
| DVB-CAM | CA-module that complies with the DVB Common Interface specification |
| DVB-data | Digital Video Broadcasting – Data Broadcasting |
| DVB-S | Digital Video Broadcasting – Satellite |
| DVB-T | DVB-Terrestrial |
| E-AC-3 | Enhanced Audio Codec 3 |
| E-EDID | Enhanced Extended Display Identification Data (regarding HDMI interface) |
| EBU | European Broadcasting Union |
| ECCA | European Cable Communications Association |
| ECL | EuroCableLabs, technical cell of ECCA |
| EICTA | European Information & Communications Technology Industry Association |

| VPN | Virtual Private Network |
| VSF | Vestigial SideBand |
| xDSL | x Digital Subscriber Line |
| XML | Extensible Markup Language |

Part II - Test Cases

1 Introduction - Test Cases

The NorDig plan specifications Test Cases are grouped into a set of test tasks, covering related tests:

- Task 1: Satellite tuner and demodulator
- Task 2: Cable Tuner and Demodulator
- Task 3: Terrestrial Tuner and Demodulator
- Task 4: IP-Based Front-end
- Task 5: MPEG2 demultiplexer
- Task 6: Video
- Task 7: Audio
- Task 8: Teletext and subtitling
- Task 9: Interfaces and Signal Levels
- Task 10: Interfaces for Conditional Access
- Task 11: The System Software Update**
- Task 12: Performance
- Task 13: Service Information
- Task 15: PVR Functionality
- Task 16: IRD System Software and API
- Task 17: User Preferences

Each of the main tasks defined above include a number of sub-tasks.

Table 1 maps the NorDig requirements [1] into the corresponding test tasks and shows the relevance per sub-task for the various NorDig profiles (“shall” indicates a mandatory requirement and a mandatory test).

| NorDig Test Task | NorDig IRD "Profile" | | | | | | | | | | | | | | |
|---|----------------------|-------|------------|-------|-------|-------|-------------------|-----------|------------|-----|-------|-----------|-----------------|-----------|------------|
| Test Task | Type | | Capability | | | | FrontEnd variants | | | | | | | | |
| | STB | iDTV | Basic | HEVC | HbbTV | PVR | satellite | DV B-S | DV B-S2 | S2X | cable | DV B-C | terr estrial | DV B-T | DV B-T2 |
| Task 3:2 General | Shall | Shall | Shall | Shall | Shall | Shall | ⌋ | ⌋ | ⌋ | ⌋ | Shall | ⌋ | Shall | Shall | Shall |
| Task 3:3 Quality reception detector | Shall | Shall | Shall | Shall | Shall | Shall | ⌋ | ⌋ | ⌋ | ⌋ | Shall | ⌋ | Shall | Shall | Shall |
| Task 3:4 Frequencies: Center frequencies | Shall | Shall | Shall | Shall | Shall | Shall | ⌋ | ⌋ | ⌋ | ⌋ | Shall | ⌋ | Shall | Shall | Shall |
| Task 3:5 Frequencies: Frequency offset | Shall | Shall | Shall | Shall | Shall | Shall | ⌋ | ⌋ | ⌋ | ⌋ | Shall | ⌋ | Shall | Shall | Shall |

2 Test Plan for NorDig - Test Cases

2.1 Task 1: Satellite tuner and demodulator

2.1.1 QEF Quality Measurement Methods

If the received signal is above C/N and C/I threshold, the Forward Error Correction (FEC) technique adopted in the System is designed to provide a "Quasi Error Free" (QEF) quality target. The QEF means less than one uncorrected error-event per transmission hour, corresponding to Bit Error Ratio (BER) = 10^{-10} to 10^{-11} at the input of the MPEG-2 demultiplexer.

If the received signal is above the C/N+I threshold, the Forward Error Correction (FEC) technique adopted in the System is designed to provide a "Quasi Error Free" (QEF) quality target. The definition of QEF adopted for DVB-S2 is "less than one uncorrected error-event per transmission hour at the level of a 5 Mbit/s single TV service decoder", approximately corresponding to a Transport Stream Packet Error Ratio PER < 10^{-7} before demultiplexer.

In practice, it takes long time to measure such a low PER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-S system, or BER after LDPC in DVB-S2 system
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-S system, the BER of $2 \cdot 10^{-4}$ after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of $2 \cdot 10^{-4}$ after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of 10^{-11} measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect objective method in the DVB-S2 system the BER of 10^{-7} after LDPC decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels.

Direct objective quality measurement procedure in DVB-S and DVB-S2 systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value 10^{-10} - 10^{-11} at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

Indirect subjective quality measurement procedure 1 (QMP1) in DVB-S and DVB-S2 systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-S system

The measurement can be performed either by using

1. the embedded BER after Viterbi measurement provided by the receiver ,or
2. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value $2 \cdot 10^{-4}$.The integrated BER after Viterbi measurement value $2 \cdot 10^{-4}$ shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than $2 \cdot 10^{-4}$, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to $2 \cdot 10^{-4}$, Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to $2 \cdot 10^{-4}$ is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-S2 system

The measurement can be performed either by using

1. the embedded BER after LDPC measurement provided by the receiver, or
2. watching the decoded video for **30 seconds**.

If the BER after LDPC measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after LDPC decoder value 10^{-7} . In case of higher BER after LDPC value than 10^{-7} , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after LDPC which is lower than or equal to 10^{-7} , Otherwise, the change of the measurement configuration parameters is repeated until the BER after LDPC value lower than or equal to 10^{-7} is achieved. That reception shall be verified that it corresponds an **error free video** decoding.

If the **30 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **30 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **30 seconds**.

Due to the nature of the DVB-S2 system forward error correction schemes the difference for the 30 seconds error free video and BER 10^{-7} after LDPC is very low. For practical testing the performance values are equal for both quality levels.

The corresponding measurement values for profile and DVB-S / DVB-S2 mode shall be achieved from tables below.

| | | C/N (E _s /N ₀) performance (dB) | |
|------------|-----------|--|--------|
| Modulation | Code Rate | DVB-S | DVB-S2 |

Table 2.1 Maximum C/N (E_s/N_0) for QEF reception (1).

Note 1: C/N measured for a bandwidth that equals the symbol rate.

Quasi-Error-Free (QEF) means less than one uncorrected error event per hour, corresponding to (MPEG TS Packet Error Rate) PER= 10^{-7} or BER = 10^{-10} to 10^{-11} at the input of the MPEG-2 demultiplexer.

Note 2: For DVB-S2 Modes with QPSK and code rates 1/4, 1/3 and 2/5, the C/N (Es/No) values are optional (recommended) for satellite NorDig IRDs to support.

Note 3: DVB-S2X C/N (Es/No) performance only applies to satellite NorDig HEVC IRDs that supports DVB-S2X.

2.1.2 Test cases

| | | |
|---|---|-------------|
| Test Case | Task 1:1 General | |
| Section | NorDig Unified 3.1.1 | |
| Requirement | The NorDig IRD shall include at least one tuner/demodulator unit for reception of signals from a satelliteRF-outdoor unit. | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S, DVB-S2 satellite IRD | |
| Test procedure | <p>Purpose of test: To verify that IRD contains at least one Tuner/demodulator</p> <p>Equipment: IRD Under test</p> <p>Test procedure: This is common requirement and will be verified in the following tests.</p> | |
| Test result(s) | | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | |
| Date | | Sign |

| | | |
|---|---|--|
| Test Case | Task 1:2 General | |
| Section | NorDig Unified 3.1.2 | |
| Requirement | The NorDig IRD shall be able to automatically scan through the whole frequency range available for each of the available Tuners/Demodulators and tune in to the correct DVB framing structure, channel coding and modulation to deliver the incoming transport stream to the next units. The tuning data shall be stored in a service list, in order to allow a quick tune in to the selected transport stream. | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S, DVB-S2-satellite IRD | |
| Test procedure | <p>Purpose of test: To verify that IRD is able to scan through the whole frequency range.</p> <p>Test procedure: This is common requirement and will be verified in the following tests.</p> | |
| Test result(s) | The manufacturer describes his specific setup for the test | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | |

|---|---|--|--|
| Test Case | Task 1:8 Control signals | | |
| Section | NorDig Unified 3.2.5 | | |
| Requirement | The Tuner/Demodulator shall be able to select between at least two RF units, upper and lower band as well as polarisation within each unit in accordance with EN 61319-1 [13], level 1 (the "DiSEqC" specification, level 1.0). | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S, DVB-S2 Satellite IRD | | |
| Test procedure | <p>Purpose of test: To verify that the IRD is able to select between two RF-units.</p> <p>Equipment: DTH antenna with dual-feed Universal LNBs, pointed at i.e. '1 degree W' and '5 degree E' or test signals are created using the test bed shown below:</p> | | |

| | |
|-----------------------|---|
| |  <p>A DiseqC-switch is used to select between the LNBs.</p> <p>Test procedure: Check that tuning to carriers in both '1 degree W' and '5 degree E' (or test bed signals) is possible by DiseqC command.</p> <p>Expected result: All signalled channels are installed and IRD decodes picture and sound without any visible degradation.</p> |

| | |
|---|--|
| Test Case | Task 1:9 Demodulation (DVB-S2) |
| Section | NorDig Unified 3.2.4 |
| Requirement | Demodulation, descrambling and error correction shall be performed for all symbol rates given above and for all error correction rates and filter roll-off rates as specified for DVB-S, see in ETSI EN 300 421 [11] for DVB-S2, see ETSI EN 302 307 [20] and for DVB-S2X, see ETSI EN 302 307-2 [81] and the satellite_delivery_system_descriptor, see Table 13.1. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S2 Satellite IRD, S2X |
| Test procedure | <p>Purpose of test: To verify the basic performance of the IRD.</p> <p>Equipment: Test signals are created using the test bed shown below:</p>  <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Configure wanted signal to center frequency 1500 MHz, DVB-S QPSK, FEC=1/2, 10Mbaud at level -40dBm. 2. Power on IRD. |

3. Make a channel search at wanted signal and verify that IRD locks to carrier and decodes picture without any visible degradation.
4. Increase the C/N from low value to higher value until the QMP2 criteria fulfills.
5. Fill in the C/N value to the measurement record table.
6. Repeat the test for all modulation, FEC and symbol rate combinations in the measurement record tables.

Note: C/N measured for a bandwidth that equals the symbol rate ($E_s/N_0=C/N$).

Expected result:

IRD decodes picture and sound without any visible degradation.

IRD meets the requirements of Nordig Unified 3.1 section 3.2.4 and IRD E_s/N_0 performance meets the requirements of Nordig Unified 3.1 section 3.2.8.

| Test Case | Task 1:10 RF Input Connector and Output Connector (option) |
| Section | NorDig Unified 3.2.7.1 |
| Requirement | <p>The NorDig IRD shall include one input connector, type: IEC 61169-24, F-type, female, 75 ohms.</p> <p>The NorDig IRD should include one output connector, type: IEC 61169-24, F-type, female, 75 ohms.</p> <p>The RF output shall be available independently from the operational status of the IRD (operational or stand by), so that there is no restriction for the operation of the connected equipment. The control of the RF unit has to be solved for the case with one or more additional IRDs.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S, DVB-S2 Satellite IRD |

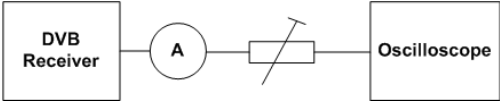

| | |
|-----------------------|--|
| Test procedure | Purpose of test: To verify that the receiver has a correct input connector for the reception of the DVB-S signals. Equipment: IRD under test. Test procedure: <ol style="list-style-type: none"> 1. Verify that the RF input and output connectors are accordance the specification IEC 61169-24, F-type, female. 2. Verify in the manufacturer's technical specification that the input impedance of the RF input is 75 ohm and the return loss is typically 10dB, worst case 8dB. Expected result: RF input connector is as defined in specification IEC 61169-24 and the input impedance is 75ohm. |

| Test Case | Task 1:14 Performance: Digital interference |
| Section | NorDig Unified 3.2.8 |
| Requirement | IRD decodes picture and sound without any visible degradation. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-S, DVB-S2 Satellite IRD, S2X |
| Test procedure | <p>Purpose of test: To verify the performance of the IRD in a multi-carrier environment.</p> <p>Equipment: Test signals are created using the test bed shown below:</p>  <p>Test procedure: UACI/LACI: Symbol rate and power equal to wanted carrier. Frequency separation from wanted carrier: $\pm 1.25(1 + \alpha)SR$ where α = Roll-Off factor ($\alpha = 0.25$ for DVB-S carriers and $\alpha = 0.2$ for DVB-S2 and DVB-S2X carriers in this test), SR = Symbol Rate.</p> |

Verify that IRD can receive input signals with a level in the range -25 to -650 dBm

1. Configure wanted signal to IF frequency 1500 MHz, DVB-S QPSK, FEC=7/8, 10Mbaud at level -650dBm and interferer signal on $f(\text{IF})+1.25\text{SR} = 1512,5 \text{ MHz}$ with power level and transmission parameters equal to the wanted signal.
2. Power on IRD.
3. Make a channel search at wanted signal and verify that IRD locks to carrier and decodes picture without any visible degradation.
4. Apply Gaussian noise over the wanted signal so that reception is not possible.
5. Increase the C/N from low value to higher value until the reception quality meets QMP2.
6. Fill in the result in the measurement record.

Repeat the test for the centre frequencies and modes in the measurement record.

Expected result:

IRD decodes picture and sound without any visible degradation. The minimum Es/No meets the requirement in NorDig Unified specification [1] with 0,45dB allowance.

2.2 Task 2: Cable Tuner and Demodulator

2.2.1 QEF Quality Measurement Methods

The quality limit in this specification is defined as Quasi Error Free (QEF) reception, where QEF means less than one uncorrected error event per hour. The definition of QEF corresponds to BER of 10^{-11} in the TS data at input of the MPEG-2 demultiplexer. In practice, it takes long time to measure such a low BER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-C system, or
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-C system, the BER of $2 \cdot 10^{-4}$ after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of $2 \cdot 10^{-4}$ after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of 10^{-11} measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect subjective measurement method the certain period of time of error free video decoding is considered to corresponds to a good reception quality. The specified video test sequence can be any containing movement everywhere, in order to minimise the number of errors not being observed due to error concealment techniques in the receiver. Such a relevant video sequences are e.g. 'Mobile and calendar' and 'Zoneplate'.

The result of the indirect quality measurements may differ. Therefore, the method that shall be used is specified in every test case. However, the reception quality shall be verified by using the subjective measurement method for every test case. The measurement methods (procedures) are defined below.

Direct objective quality measurement procedure in DVB-C systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value 10^{-11} at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

Indirect subjective quality measurement procedure 1 (QMP1) in DVB-C systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-C system

The measurement can be performed either by using

3. the embedded BER after Viterbi measurement provided by the receiver ,or
4. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value $2 \cdot 10^{-4}$.The integrated BER after Viterbi measurement value $2 \cdot 10^{-4}$ shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than $2 \cdot 10^{-4}$, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to $2 \cdot 10^{-4}$, Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to $2 \cdot 10^{-4}$ is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

2.2.2 Test cases

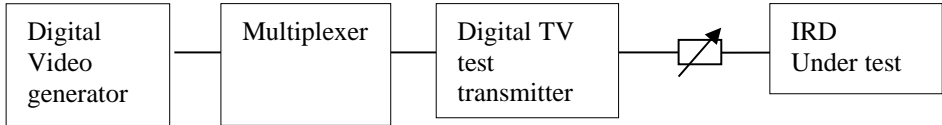

| | | | |
|---|--|-------------|--|
| Test Case | Task 2:1 General | | |
| Section | NorDig Unified 3.1.1 | | |
| Requirement | The NorDig IRD shall contain at least one Tuner/Demodulator for cable DVB/MPEG 2 signals. | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-C Cable IRD | | |
| Test procedure | <p>Purpose of test: To verify that IRD contains at least one Tuner/demodulator</p> <p>Equipment: IRD Under test.</p> <p>Test procedure: This is common requirement and will be verified in the following tests.</p> | | |

| | Task 2:15 RF Performace - C/N with echo |
| Section | NorDig Unified 3.3.5.4 |
| Requirement | The NorDig IRD shall perform as specified in Table 3.43, plus an allowance of 1 dB when an echo is applied in accordance to the template in Figure 3.1. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-C Cable IRD |

Test procedure

Purpose of test:

To verify the required C/N when echoes are present.

Equipment:

Test procedure:

1. Set up the test instruments
2. Use the following settings { 256 QAM, SR=6.952, 666 Mhz, delay 0 ns }
3. Measure the input level to the attenuator.
4. Determine the attenuation of the attenuator and the cables.
5. Calculate the receiver input signal level and set it to 54dBμV.
6. Use the value for the required C/N+1 dB specified in table 3.4 in NorDig Unified specification [1].
7. Do the channel search.
8. Increase the C/N from low value to higher value until the quality measurement procedure 2 fulfils.
9. Fill in the measured value in dB in the measurement record.
10. Repeat the test for the rest of the modes and delays defined in the measurement record.

Expected result:

The measured C/N shall be within required C/N + 1 dB.

| Test Case | Task 2:16 Performance Data: Noise figure |
| Section | NorDig Unified 3.3.5.1 |
| Requirement | The performance data below shall be satisfied: Noise figure: less than 8 dB. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-C Cable IRD |

Test procedure

Purpose of test:

To verify the receiver noise figure performance.

Equipment:

Test procedure:

1. Set up the test instruments
2. Use the following settings { 256 QAM, SR=6.952 , roll-off 0.15}.
3. Use the channel K45 (666 MHz)
4. Measure the input level to the attenuator.
5. Determine the attenuation of the attenuator and the cables.
6. Calculate the receiver input signal level and set it to 59 dBμV.
7. Do the channel search.
8. Increase the C/N from low value to higher value until the quality measurement procedure 2 fulfils.
9. Fill in the measured C/N value in dB in the measurement record.
10. Shutdown added noise.
11. Decrease the signal input level to such a level that receiver is not able to provide picture.
12. Increase the signal input level to receiver until the quality measurement procedure 2 fulfills.
13. Fill in the sensitivity P_{min} value in dBμV in measurement record.
14. Repeat the test for the rest of the frequencies defined in the measurement record.
15. Calculate the NF using formula: $NF[dB] = P_{min} - C/N - 3.8 \text{ dB}\mu V$

Expected result:

Noise figure is lower than 8dB.

2.3 Task 3: Terrestrial Tuner and Demodulator

2.3.1 Test equipment summary

To configure the minimum test setups described in these test procedures the following functionalities are needed:

Video and audio source (MPEG-2)
Re-multiplexers
Broadband Fading simulator
Noise generator
DVB-T/T2 Exciter (DVB-T/T2 modulator and up-converter)
Analog TV RF Exciter with PAL, NICAM and teletext generator.

DVB-T or DVB-T2 receiver with RF input
Transport stream analyzers
Power meter with thermo coupled 50ohm and 75ohm power sensor
Video monitor

Note! The needed instruments may vary depending on the used system and can be purchased from many vendors in a compact all-in-one units. Different test setups are defined in every test case. However, most of the tests can be done using one general test setup.

2.3.2 QEF Quality Measurement Methods

The quality limit in this specification is defined as Quasi Error Free (QEF) reception, where QEF means less than one uncorrected error event per hour. The definition of QEF corresponds to BER of 10^{-11} in the TS data at input of the MPEG-2 demultiplexer. In practice, it takes long time to measure such a low BER at TS data level. Therefore, the reception quality can be evaluated either indirectly by

- measuring the BER after Viterbi in DVB-T system, or measuring the BER after LDPC in DVB-T2 system, or
- subjectively inspecting the video screen for a certain period of time and looking for errors in the decoded video.

Direct measurements on the TS data packets are the preferred measurement method, but if this is not possible or acceptable for some reason, the indirect measurements can be used. The indirect measurement methods, which can be used, are objective BER measurements described above or subjective quality measurement.

In the indirect objective method in the DVB-T system, the BER of $2 \cdot 10^{-4}$ after Viterbi decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels. But for channels interfered by impulse like interference i.e. PAL signals or internal interference, the average BER of $2 \cdot 10^{-4}$ after Viterbi decoder is not valid due to the fact that the RS decoder is not able to correct the burst of erroneous bytes caused by impulse like interference. Therefore, for impulse like interfered channels, the quality measurements shall be done by using the BER of 10^{-11} measurement method at the TS level at MPEG-2 demultiplexer input or by using the subjective measurement method.

In the indirect objective method in the DVB-T2 system the BER of 10^{-7} after LDPC decoder is considered to correspond to an approximation of QEF reception quality for Gaussian type of channels.

In the indirect subjective measurement method the certain period of time of error free video decoding is considered to corresponds to a good reception quality. The specified video test sequence can be any containing

movement everywhere, in order to minimise the number of errors not being observed due to error concealment techniques in the receiver. Such a relevant video sequences are e.g. 'Mobile and calendar' and 'Zoneplate'.

The result of the indirect quality measurements may differ. Therefore, the method that shall be used is specified in every test case. However, the reception quality shall be verified by using the subjective measurement method for every test case. The measurement methods (procedures) are defined below.

Direct objective quality measurement procedure in DVB-T and DVB-T2 systems

The measurement is performed doing measurements at the transport stream data level. The measurement configuration parameters are chosen like that there is less than one uncorrected error event per hour. This requirement corresponds to BER value 10^{-11} at the TS data level at the input of the MPEG-2 demultiplexer. In addition to the BER measurement, the reception quality shall be verified subjectively.

The performance in every test case can be evaluated by using the direct quality measurement procedure.

Indirect subjective quality measurement procedure 1 (QMP1) in DVB-T and DVB-T2 systems

The subjective measurement is performed during **15 seconds**. During this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **15 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is reached at least **15 seconds**.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-T system

The measurement can be performed either by using

5. the embedded BER after Viterbi measurement provided by the receiver ,or
6. watching the decoded video for **60 seconds**.

If the BER after Viterbi measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after Viterbi decoder value $2 \cdot 10^{-4}$. The integrated BER after Viterbi measurement value $2 \cdot 10^{-4}$ shall be verified that it corresponds an **error free video** decoding. In case of higher BER after Viterbi value than $2 \cdot 10^{-4}$, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after Viterbi which is lower than or equal to $2 \cdot 10^{-4}$, Otherwise, the change of the measurement configuration parameters is repeated until a BER after Viterbi value lower than or equal to $2 \cdot 10^{-4}$ is achieved.

If the **60 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **60 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **60 seconds**.

The corresponding measurement value for profile and DVB-T mode shall be achieved from tables below.

| Modulation | Code rate | C/N performance (dB) | | | |
|------------|-----------|---------------------------------|---------------------------|---------------------------------|---------------------------|
| | | Profile 1 : Gaussian | | Profile 2 : 0 dB echo | |
| | | “60 sec error free video” | BER 2E-4 after Viterbi | “60 sec error free video” | BER 2E-4 after Viterbi |
| QPSK | 1/2 | 3.8 | 5.1 | 7.7 | 8.8 |
| QPSK | 2/3 | 5.6 | 6.9 | 11.9 | 13.7 |

Table 2.3 Minimum signal input levels (Pmin) for “60 seconds error free video” and BER 2E-4 after Viterbi (with 1/4 guard interval and FFT size 8K) for profiles 1 and 2.

Indirect objective or subjective quality measurement procedure 2 (QMP2) in DVB-T2 system

The measurement can be performed either by using

3. the embedded BER after LDPC measurement provided by the receiver, or
4. watching the decoded video for **30 seconds**.

If the BER after LDPC measurement is chosen, the value for the approximation of the QEF reception is considered to correspond to the integrated BER after LDPC decoder value 10^{-7} . In case of higher BER after LDPC value than 10^{-7} , the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to a BER after LDPC which is lower than or equal to 10^{-7} . Otherwise, the change of the measurement configuration parameters is repeated until the BER after LDPC value lower than or equal to 10^{-7} is achieved. That reception shall be verified that it corresponds an **error free video** decoding.

If the **30 seconds** error free decoded video is chosen, during this time the decoded video shall be error free. In a case of an error in decoded video, the change to the measurement configuration parameters shall be done. The change of the measurement configuration parameters shall result to an error free decoding of the video where the minimum time between consecutive subjective errors is **30 seconds**. Otherwise, the change of the measurement configuration parameters is repeated until an error free decoding of video is achieved at least **30 seconds**.

Due to the nature of the DVB-T2 system forward error correction schemes the difference for the 30 seconds error free video and BER 10^{-7} after LDPC is very low. For practical testing the performance values are equal for both quality levels.

The corresponding measurement value for profile and DVB-T2 mode shall be achieved from tables below.

| Modulation | Code rate | C/N performance (dB) for PP2 | | | |
|------------|-----------|---------------------------------|------------------------|---------------------------------|------------------------|
| | | Profile 1 : Gaussian | | Profile 2 : 0 dB echo | |

Table 2.8 Minimum DVB-T2 signal input levels (Pmin) for “30 seconds error free video” and BER 1E-7 after LDPC for PP2 and for any allowed combination of guard interval, signal bandwidth, FFT size and extended carrier mode. Values are equal for normal carrier mode except for 8MHz signal BW where 0.1dB is 89 subtracted. Before 1.1.2012 the values for non-S-band channels may be increased with 1 dB, excluding 1.7MHz bandwidth columns, due to a 1 dB relaxation in noise figure.

Table 2.11 Minimum DVB-T2 signal input levels (Pmin) for “30 seconds error free video” and BER 1E-7 after LDPC for PP7 and for any allowed combination of guard interval, FFT size and extended carrier mode. Values are equal for normal carrier mode except for 8MHz signal BW where 0.1dB is 92 subtracted. Before 1.1.2012 the values for non-S-band channels may be increased with 1 dB, excluding 1.7MHz bandwidth columns, due to a 1 dB relaxation in noise figure.

2.3.3 Bitrates

The different DVB-T/T2 modes define different bitrates for the transport stream. The following table defines the bitrates for the transport stream in Mbit/s. For DVB-T2 bit rate calculation combination highest time interleaving depth and highest number of symbols per frame resulting highest bit rate is used.

| 8MHz, 2k / 8k | | | | | |
|---------------|-----|-----------|-----------|-----------|-----------|
| Modulation | FEC | Tg=1/32 | Tg=1/16 | Tg=1/8 | Tg=1/4 |
| QPSK | 1/2 | 6.032086 | 5.854671 | 5.529412 | 4.976471 |

Table 2.16 Bitrates for the transport stream in Mbit/s for 1.7MHz DVB-T2 signal bandwidth.

The video and audio compression technique of the content within transport stream doesn't have any influence to RF performance test results. Therefore, following content compression with given bit rate applies for all tests excluding DVB-T2 receiver buffer model tests where requirement for lower transport stream bit rate is necessary in order to stress the receiver buffer correctly.

Normal test content conditions:

The used video is MPEG-2 elementary stream in resolution 720x576. The video bitrate within transport stream is 4.0 Mbit/s.

The used audio is MPEG-1 elementary stream in stereo mode. The audio bitrate is 128kbit/s per channel.

Test tasks Task 3:41, Task 3:42, Task 3:43 and Task 3:46:

A transport stream bit rate shall be equal or below 3.3 MBit/s. Video and audio content carried within transport stream shall be selected so that transport stream bit rate condition is met.

2.3.4 Receiver operability in SFN

The SFN synchronisation of the receiver depends on the echo delay and attenuation level in the SFN. The SFN synchronisation of the receiver may also depend of the state of the receiver. Therefore, it is important to evaluate if the receiver synchronises differently in the following situations:

1. When the receiver is restarted completely (AC cord disconnected).
2. When the receiver is powered on in standby mode. The last good SFN synchronisation parameters can be saved to memory for faster SFN synchronisation leading that the dynamical change of the delay during the receiver is in standby mode gives bad result on power up.
3. During the channel search.
4. Connecting and disconnecting the input RF signal (closing and opening of the RF switch as in test cases). Discontinued input RF signal tests the SFN synchronisation algorithm when the receiver is forced to an unlocked state, e.g. when transmission is discontinued.
5. Zapping between services on different frequencies. Different frequencies have different echo delays and attenuation levels. This corresponds the real reception.
6. During the over-the-air software upgrade. If the demodulator is not correctly controlled during the software download, the SFN synchronisation problems can lead that the software cannot be updated.

Evaluation of the SFN synchronisation can be done e.g. when an echo delay and amplitude level combination is founded to be difficult to synchronise. In that case methods above are tested. Decide which method can be used to evaluate the SFN synchronisation algorithm of the receiver. Check also that all the other methods work. Independently of the state of the receiver all the listed methods above shall work.

The receiver shall detect correct synchronization in SFN, maintain it and provide reception quality at required quality level independently if the received signal changes from bad conditions to good conditions or vice versa. E.g. when testing and finding the required C/N in test cases, the receiver must be able to detect correct synchronization in SFN, maintain it and provide reception quality at defined quality level when C/N value is changed from low (bad reception condition) value to higher (better reception condition) value.

2.3.5 0dB echo

The 0 degree channel center shall be used in fading simulator. In this context it means that the carriers from the direct and echo signal are cumulative. See figure below for 0dB 1.95 μ s echo.

2.3.6 Conditions for analogue TV

The level of the analog TV signal is defined to be the power during the sync pulse of the vision carrier. The power of the sync pulse of the vision carrier shall be measured when the video input of the analogue TV modulator is connected to 75ohm load, in other words, there is no modulation in the vision carrier. 10% modulation depth is used for vision carrier.

The level of the FM sound relative to the vision carrier is -13 dB. The frequency of FM sound carrier is +5.5 MHz relative to vision carrier.

The level of the NICAM signal relative to the vision carrier is -20 dB. The frequency of the NICAM carrier is +5.85MHz relative to vision carrier.

It shall be verified that the analog TV signal doesn't have too high out-of-band emissions, which could cause interference to other frequencies.

The equipment used for generation of the analog TV shall be connected to same frequency reference signal as the digital TV equipment.

2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks

Manufacture shall ensure the functionality of the receiver in all required DVB-T2 parameter settings specified in (1). Also, manufacture shall ensure the performance as required in (1) for the subset of the DVB-T2 modes although in test cases the amount of the DVB-T2 may have been reduced in order to minimise the test time.

Summary of mandatory parameters settings for single and multiple PLP DVB-T2 modes are listed in Table 2.176 and Table 2.187 used in DVB-T2 test tasks. In every test case any deviations to the common parameters are specified.

Table 2.18 DVB-T2 mode parameters in DVB-T2 Multiple PLP (mode B) test tasks. *) any allowed value **) maximum achieved value may depend on content in PLPs

Due to the deployment situation for DVB-T2 transmissions in networks is different, several alternatives for L_f and FEC blocks / interleaving frame are given.

Normally signal bandwidth of the DVB-T2 mode is specified for the on-air signals on VHF and UHF frequencies. For off-air signals in cable networks the signal bandwidth relation to frequency band is not obvious, e.g. when reception from on-air 8MHz signal bandwidth on UHF is downconverted to VHF off-air distribution.

2.3.8 Stream packet structure in Receiver Buffer Model (RBM) tests for DVB-T2

Test tasks Task 3:41, Task 3:42, Task 3:43 and Task 3:46 stress the receiver buffer model. TS contains a service with a real video and audio. Prerequisite is that the modulator shall support V&V packet generation architecture. Figure 2 shows Task 3:41 chapter 2 packet structure. Compilation of the TSs to PLPs and recompilation back to TSs are explained more detailed in [4]. Video and audio content carried within common PLP is used for test purposes in order to make it possible to test IRD subjectively. Most probably that is not a normal use of common PLP although common PLP allows contain video and audio content. To make sure broadcast network operator's use of common PLP, the broadcast network operator should be consulted.

Defined RBM test method can only test one PLP at a time, therefore the RBM tests have to be run with a separate stream for each PLP to be tested.

Figure 2. Example of compilation of Task 3:41 TSs to PLPs and recompilation back to TSs. Figure shows only chapter 2 where repetition is 1 for a modulator supporting V&V stream compilation and IRD demodulating the received DVB-T2 signal. The recompiled TS0 results to a valid TS for decoding.

2.3.9 Test cases

2.3.9.1 Test cases – DVB-T IRD

| | | | |
|---|---|-------------|--|
| Test Case | Task 3:1 General | | |
| Section | NorDig Unified 3.4.1 | | |
| Requirement | The NorDig IRD shall include at least one tuner/demodulator for reception of signals from terrestrial transmitters, broadcasting in accordance with EN 300 744 [21] (DVB-T). | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | |
| Test procedure | <p>Purpose of test: To verify the possibility of the reception of the DVB-T signal.</p> <p>Equipment: An IRD.</p> <p>Test procedure: Make sure that the IRD has one tuner/demodulator for reception of terrestrial signals.</p> <p>Expected result: IRD has one tuner/demodulator for terrestrial reception.</p> | | |
| Test result(s) | | | |
| Conformity | <input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|--|--|--|
| Test Case | Task 3:2 General | | |
| Section | NorDig Unified 3.1.2 | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | |
| Requirement | The NorDig IRD shall be able to automatically scan through the whole frequency range available for each of the available Tuners/Demodulators and tune in to the correct DVB framing structure, channel coding and modulation to deliver the incoming transport stream to the next units. The tuning data shall be stored in a service list, in order to allow a quick tune in to the selected transport stream. For more detail see below. | | |
| Test procedure | <p>Purpose of test: To verify that IRD is able to scan through the whole frequency range.</p> <p>Test procedure: This is common requirement and will be verified in the following tests.</p> | | |

| | | | |
|-----------------------|---|-------------|--|
| Test result(s) | The manufacturer describes his specific setup for the test | | |
| Conformity | <input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|--|-------------|--|
| Test Case | Task 3:3 Quality reception detector | | |
| Section | NorDig Unified 3.1.3 | | |
| Requirement | The NorDig Unified receiver shall be equipped with a reception quality detector. | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | |
| Test procedure | Equipment: IRD under test. Test procedure: Check that the IRD is equipped with a reception quality detector Expected result: It shall be possible to access some kind of a reception quality detector. | | |
| Test result(s) | | | |
| Conformity | <input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|--|--|--|
| Test Case | Task 3:4 Frequencies: Center frequencies | | |
| Section | NorDig Unified 3.4.2.1 and 3.4.2.2 | | |
| Requirement | The NorDig IRD shall be able to receive channels in VHF band III and UHF bands IV, V and should be able to receive channels in VHF S band I, VHF S band II, UHF S Band III. The front-end shall for the supported frequency ranges be capable of tuning to the center frequency f_c of the incoming DVB-T RF signal, see below. 8MHz raster: $f_c = 114 \text{ MHz} + K * 8 \text{ MHz}$, where $K = 0 \dots 9384$ 7MHz raster: $f_c = 107.5 \text{ MHz} + L * 7 \text{ MHz}$, where $L = 0 \dots 27$ | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | |
| Test procedure | Purpose of test: | | |

To verify the reception over the supported frequency range.

Equipment:

Test procedure:

1. Set up the test instruments
2. Use the following mode 8k 64QAM, HP Code rate=2/3, Guard interval $T_U/8$
3. Use input level of -60 dBm
4. Start with frequency 177,5MHz (K5)
5. Use the quality measurement procedures 1 (QMP1).
6. Fill the result in the measurement record: **OK** or **NOK**.
7. Repeat the test for all channels in the table 1 in the measurement record.
8. If the receiver supports optional frequency ranges, test all remaining channels in table 2 and 3 in the measurement record.

Expected result:

The result of the test shall be OK for all channels in table 1.

For the optionally supported frequency ranges, the tests shall be OK for the channels in the tables 2 and 3.

Test result(s)

|---|---|
| Test Case | Task 3:5 Frequencies: Frequency offset |
| Section | NorDig Unified 3.4.2.3 |
| Requirement | The NorDig IRD shall be able to receive signals with an offset of up to 50kHz from the nominal frequency. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify that the reception is possible in specified frequency offset from nominal frequency.</p> <p>Equipment:</p>  <pre> graph LR TS[TS Source] --> DVB_T_mod[DVB-T modulator] DVB_T_mod --> Fading[Fading simulator] Fading --> Noise[Noise generator] Noise --> Up[Up converter] Up --> Power[Power meter] Power --> DVB_T_rec[DVB-T receiver] DVB_T_rec --> Monitor[Monitor] </pre> |

| | <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Set up the test instruments 2. Use the following mode: 8k, 64QAM, Code rate=2/3, Guard interval $T_U/8$ 3. Use input level of -60 dBm 4. Set the center frequency to 177.5 MHz and frequency offset to 0 kHz. Use signal bandwidth 7MHz. 5. Connect receiver and do the channel search if needed. 6. Test with the specified frequency offset values in the measurement record. Before changing the frequency offset, disconnect the receiver from the received RF signal. 7. Do the change of frequency offset, 8. Connect the received RF signal back to the receiver. 9. Use the quality measurement procedure 1 (QMP1) 10. Fill the result in the measurement record: OK or NOK. 11. Test the remaining frequency offset values on specified center frequencies and signal bandwidths in the measurement record. <p>Expected result: The test shall be OK for all frequency offset values on specified center frequencies and signal bandwidths.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|-------------|--|
| Test Case | Task 3:10 Tuning/Scanning Procedures: Automatic channel search for the same service bouquet |
| Section | NorDig Unified 3.4.4.4 |
| Requirement | <p>The terrestrial NorDig IRD shall provide an automatic search that finds all of the multiplexes and services in the whole (supported) frequency range, see NorDig specification. The logic of the automatic search function shall be as follows:</p> <p>If any services are detected during the automatic search the current service list shall be replaced by the new service list.</p> <p>If no services are detected during the automatic search the current service list shall be kept or deleted.</p> |

| | <p>The IRD shall only display a service once in the service list (i.e. avoiding duplicate of the same services), even if the same service (same triplet original_network_id, transport_stream_id and service_id) is received from multiple transmitters. If the same service can be received from several transmitters, the one with best reception quality shall be selected. The criteria for selection of the best received service (i.e. best reception quality) shall be based on the combination of the signal strength and signal quality according to NorDig specification.</p> | | | | | | | | | | | | | | | |
|--|--|-------------|-----|-------------|----|---|---|----|---|---|----|---|---|----|---|---|
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | | | | | | | | | | | | | | |
| Test procedure | <p>Purpose of test:</p> <p>To verify the best service selection in automatic channel search when the content of the transport stream is the same on several transmitters.</p> <p>Equipment:</p> <div></div> <div><p>Channels A and B</p><p>TS source #1</p><p>ONID=8945</p><p>Network ID=1000</p><p>Network Name=Net1</p><p>TSID=100</p><p>Services</p><table><tr><th>Name</th><th>SID</th><th>Logic Ch No</th></tr><tr><td>S1</td><td>1</td><td>1</td></tr><tr><td>S2</td><td>2</td><td>2</td></tr><tr><td>S3</td><td>3</td><td>3</td></tr><tr><td>S4</td><td>4</td><td>4</td></tr></table></div> | Name | SID | Logic Ch No | S1 | 1 | 1 | S2 | 2 | 2 | S3 | 3 | 3 | S4 | 4 | 4 |
| Name | SID | Logic Ch No | | | | | | | | | | | | | | |
| S1 | 1 | 1 | | | | | | | | | | | | | | |
| S2 | 2 | 2 | | | | | | | | | | | | | | |
| S3 | 3 | 3 | | | | | | | | | | | | | | |
| S4 | 4 | 4 | | | | | | | | | | | | | | |
| | <p>There is a possibility to receive broadcasts from several transmitters simultaneously in DVB-T network. These transmitters can have exactly the same content, but are transmitted on different channels (frequencies). Therefore, it is important that the receiver can choose by an automatic channel search the services with the best reception quality.</p> | | | | | | | | | | | | | | | |

Test to verify broadcast where equal services are broadcasted simultaneously over DVB-T and DVB-T2 networks is not required.

Reception quality can be divided into two different parameters:

- Signal strength
- Signal quality

Signal quality can be divided into two main parameters:

- Signal-to-noise ratio (C/N)
- Bit error rate before Reed Solomon (BER before RS in DVB-T system)

Channels A and B shall not be equal.

Relative signal levels can be observed on spectrum analyser.

ΔS refers to difference in SSI according to [1] Annex D.

ΔQ refers to difference in SQI according to [1] Annex D.

AWGN refers to Additive White Gaussian Noise.

Test points 10-13 in table 1920 below require the BER in each channel to be set in a specific way. Different signal generators provide different methods to degrade the signal. For example carriers can be disabled, or I/Q quadrature error introduced to achieve a specific BER.

As a pre-requisite to perform this test, IRD shall correctly pass the following tasks:

- Task 3:13 Verification of Signal Strength Indicator (SSI)
- Task 3:14 Verification of Signal Quality Indicator (SQI)

Measurement record 2 shows the minimum tests that shall be performed. Signal levels and signal quality (i.e added AWGN or additional BER impairments) can be adjusted from the initial values shown to ensure the required ΔS and ΔQ conditions are met.

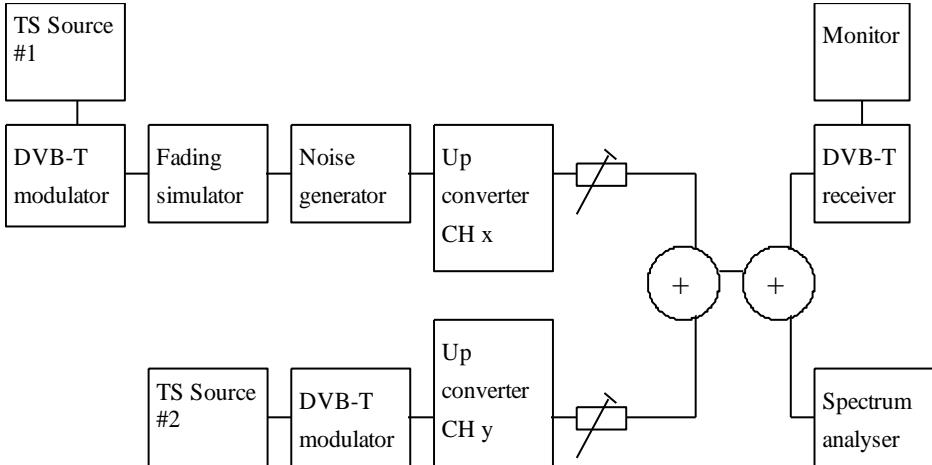

Test procedure:

1. Configure the transport stream and setup the instruments. Use the DVB-T mode 8k 64QAM $R=2/3$ $\Delta/T_u=1/8$.
2. Set the signal level of the both carriers CH A and CH B to the same level. The signal level shall correspond good reception quality (no errors in decoded video).
3. Perform automatic channel search. The logic of the automatic search function shall be as follows:
 - If any services are detected during the automatic search the current service list shall be replaced by the new service list.
 - If no services are detected during the automatic search the current service list shall be kept or deleted.
4. Check that the channel list has services configured in the transport stream.
5. Check that the services on the channel list is listed once and not duplicated. Check which channel is received by trying to attenuate the signal level. The services from received channel are frozen when the signal level is too low. [Restore the attenuations to the level before it was changed.](#)
6. Fill in OK or NOK in the measurement record 1 depending if the services were deleted.
7. Fill in OK or NOK in the measurement record 2 depending if the services were installed from expected channel.

| | 8. Repeat the test for the rest of the test points in the measurement record 2. | | | | | | | |
|---|---|-------------|-------------|---------------------|---|--|--|--|
| | Expected result: All the test results are OK. | | | | | | | |
| Test result(s) | Measurement record 1: <table border="1"> <thead> <tr> <th>Requirement</th><th>Result OK or NOK</th></tr> </thead> <tbody> <tr> <td> The logic of the automatic search function shall be as follows: If any services are detected during the automatic search the current service list shall be replaced by the new service list. | Services | | | | Services | | | |
|----------|-----|-------|-------|----------|-----|-------|-------|
| Name | SID | Logic | Ch No | Name | SID | Logic | Ch No |
| S1 | 1 | | 1 | S1 | 1 | | 1 |
| S2 | 2 | | 2 | S5 | 5 | | 2 |
| S3 | 3 | | 3 | S6 | 6 | | 6 |
| S4 | 4 | | 4 | | | | |

The TS configuration idea in this test is that on terrestrial network there is possibility to receive several transmitters simultaneously. These transmitters can have partially same content (nationwide services) and partially different content (regionwide services).). It is the ON_id, TS_id and Service_id which define a service unique. The Network_id can be analysed to distinguish the differences in the TS. Therefore, it is important that the receiver can in automatic channel search choose the services which have the best reception quality and even find the regionwide services.

Channels x and y shall not be equal.

Test procedure:

This test procedure tests combination of the signal level and reception quality.

1. Configure transport streams and setup the instruments. Use DVB-T mode 8k 64QAM R=2/3 $\Delta/T_u=1/8$.
2. Set the signal level of the carrier CH x to a signal level which is about 5dB **higher** than the signal level of the carrier CH y. Both signal levels shall correspond good reception quality (no errors in decoded video).
3. Add noise on carrier CH x to a level that the QMP1 is fulfilled.
4. Perform automatic channel search. The logic of the automatic search function shall be as follows:
 - If any services are detected during the automatic search the current service list shall be replaced by the new service list.
 - If no services are detected during the automatic search the current service list shall be kept or deleted.
5. Check that channel list has services configured in transport streams.

After performing the test the channel list shall be as below:

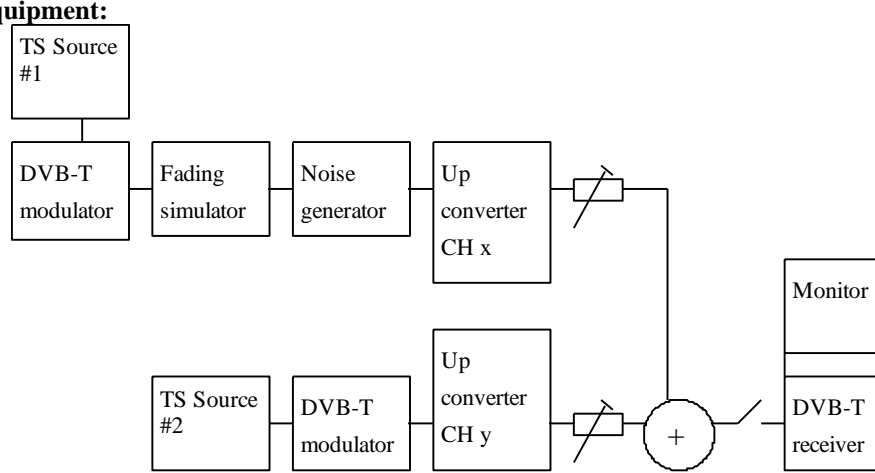

| Position | Service | Channel |
|----------|---------|---------|
| 1 | S1 | Y |
| 2 | S5/S2 * | Y/X |
| 3 | S3 | X |
| 4 | S4 | X |
| 6 | S6 | Y |
| 7 | S2/S5 * | X/Y |

*) Note that order of the services S2 and S5 on the channel list can be chosen by the manufacture. It's highly recommended that the S5 (service without visible errors) is stored in position 2 and the S2 (service with visible errors) is stored in position 7. And generally it is recommended that service detected by the receiver as "better" service is stored in that position which is signalled in Logic Channel No and the other services with same Logic Ch No stored later in the list).

Expected result:

All the tests are OK.

| | | |
|----|---|---|
| S1 | 1 | 1 |
| S5 | 5 | 2 |
| S6 | 6 | 6 |

The TS configuration idea in this test is that on terrestrial network there is possibility to receive several transmitters simultaneously. These transmitters can have partially same content (nationwide services) and partially different content (regionwide services). It is the ON_id, TS_id and Service_id which define a service unique. The Network_id can be analysed to distinguish the differences in the TS. Furthermore, regional services may have same LCN which results to a conflict. Finally, it is important that user can force the receive to search all services within TS by selecting the channel number and install services from that TS on channel list without any quality criteria.

Test procedure:

1. Configure transport streams and setup the instruments.
2. Check that channel list is empty. If it is not empty delete all services.
3. Attenuate the carrier on CH x to a signal level that it is not possible to receive.
4. Perform automatic channel search.
5. Check that the services S1, S5 and S6 on channel list are from carrier on CH y by attenuating the carrier on CH y. If the received channel is correct the services S1, S5 and S6 shall be frozen when the signal level is too low. Restore the attenuation level back to same level it was before you started to change it.
6. Decrease the attenuation of the carrier on CH x to a signal level that the carrier is possible to be received. Add noise on carrier CH x to a level that QMP1 is fulfilled.
7. Perform manual channel search. Check that the carrier, which is wanted to be searched, is given in channel number format.
8. Fill in the measurement record.
9. Check that services S1, S2, S3 and S4 on channel list are from carrier on CH x by attenuating the carrier on CH x. If the received channel is correct the services S1, S2, S3 and S4 shall be frozen when the signal level is too low. Restore the attenuation level back to same level it was before you started to change it.
10. Check that service S1 is not listed twice on channel list.

The channel list shall look like this after performing this procedure:

| Position | Service | Channel |
|----------|---------|---------|
| 1 | S1 | X |
| 2 | S2/S5 * | X/Y |
| 3 | S3 | X |
| 4 | S4 | X |
| 6 | S6 | Y |
| 7 | S5/S2 * | Y/X |

*) Note that order of the services S2 and S5 can be chosen by the manufacture.. It is highly recommended that the services found in the last manual channel search are stored in the service list according to their signalling.

| | <p>In terrestrial networks in a case where received services have equal ON_id, TS_id and LCN, but Network_id and Service_id differ most probably means regional variations of the same service. In that case it is highly recommended to move already stored service to an other position in the channel list and store the service found in the last manual channel search to position signaled in the LCN.</p> <p>Expected result: All test results shall be OK.</p> | | | | | | | | |

| Test Case | Task 3:13 Verification of Signal Strength Indicator (SSI) |
| Section | NorDig Unified 3.4.4.6 |
| Requirement | <p>The NorDig IRD shall be provided with a signal strength indicator (SSI). The value for the SSI shall be referred to the IRD RF signal input.</p> <p>The NorDig IRD shall be able to determine signal strength within a range starting from 15 dB lower than the reference signal level defined in NorDig Specification and up to 35dB above that value or maximum signal input level defined in NorDig IRD sSpecification.</p> <p>The absolute accuracy shall be ± 5 dB at RF signal input levels -80 dBm to -60 dBm and ± 7 dB for RF signal input levels higher than -60 dBm.</p> <p>The relative accuracy should be ± 3 dB between center frequencies within one frequency band, e.g. VHF Band III or UHF Band IV/V, supported by the receiver.</p> <p>Signal strength indicator shall have a relative numerical value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal strength indicator shall be updated regularly once per second.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the correct functionality of the signal strength indicator.</p> <p>Equipment:</p> |

Gaussian channel profile used i.e. no need for fading simulator.

In this test, the signal input level P_{input} level at the RF input must be known.

The test procedure assumes that the P_{receiver} is not displayed by the receiver. If the P_{receiver} is displayed by the receiver this test procedure can be simplified.

Test procedure:

Verify SSI values:

1. Set-up the test system
2. Determine the attenuation of the test system so that the signal input level at the receiver input is known in the measured frequencies.
3. Use the following DVB-T mode {8K, 64QAM, $R=2/3$, $\Delta/T_U=1/8$ } and signal bandwidth of 8MHz.
4. Set the up-converter to frequency 474MHz (K21).
5. Set the signal level into the receiver according to measurement record 1.
6. Do the channel search.
7. Fill in the SSI value displayed by the receiver in the measurement record 1.
8. SSI_{min} and SSI_{max} defines the allowed range of the displayed value.
9. Fill in the measurement record 1 OK or NOK depending of the displayed SSI value.
10. Measure rest of the frequencies and DVB-T modes.
11. Fill in the measurement record 1.

Verify the relative error:

1. Convert the displayed SSI values to P_{receiver} [dBm] values. Select the correct formula for calculating P_{receiver} according to the displayed SSI value as shown below:

$$P_{\text{receiver}} = (3/2) * (SSI - 90) + 20 + P_{\text{reference}} \quad \text{if } 90 \leq SSI < 100$$

$$P_{\text{receiver}} = (1/4) * (SSI - 10) + P_{\text{reference}} \quad \text{if } 10 \leq SSI < 90$$

$$P_{\text{receiver}} = (3/2) * SSI - 15 + P_{\text{reference}} \quad \text{if } 0 \leq SSI < 10$$

2. Fill in the dBm values in the measurement record 2 for corresponding signal input level.
3. Calculate the average value of the P_{receiver} values in three frequencies within a frequency band.
4. Verify the calculated P_{receiver} [dBm] values are within ± 3 dB from the average value.
5. Fill in the measurement record 2 OK or NOK

Expected result:

All the measurements shall be OK.

The signal strength indicator value is updated regularly once per second.

| Test Case | Task 3:14 Verification of Signal Quality Indicator (SQI) |
| Section | NorDig Unified 3.4.4.7 |
| Requirement | <p>The NorDig IRD shall (1) be provided with a signal quality indicator (SQI). The value for the SQI shall be referred to the IRD RF signal input.</p> <p>The absolute accuracy of the C/N value shall be of $\pm 1\text{dB}$ for C/N values of 17 dB to 27 dB at the IRD RF signal input.</p> |

| | |
|--|---|
| | <p>The signal quality indicator shall have a relative numerical value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The integration time for the signal quality shall be over a period of 5 seconds.</p> <p>The signal quality indicator shall be updated regularly once per second.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the correct functionality of the signal quality indicator.</p> <p>Equipment:</p>  <p>Gaussian channel profile used i.e. no need for fading simulator.</p> <p>C/N_{input} refers to generated DVB-T signal C/N at receiver input.</p> <p>$C/N_{receiver}$ refers to C/N determined by the receiver under test.</p> $C/N_{rel} = C/N_{input} - C/N_{NorDigP1}$ <p>$C/N_{NorDigP1}$ refers to table 3.10 at [1].</p> <p>First we need to define the required C/N_{input} for the QMP2. After that we know what is the expected rescale of BER before the RS decoder. The slope of the curve for BER before RS as a function of the required C/N_{input} should be equal independently of the receiver. Using that knowledge SQI_{min} and SQI_{max} can be calculated.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Set up the test instruments 2. Use the following DVB-T mode {8K, 64QAM, R=2/3, $\Delta/T_U=1/8$} and signal bandwidth 8MHz. 3. Set the up-converter to frequency 666MHz (K45). 4. Do the channel search. 5. Determine the lowest required C/N by adjusting the C/N_{input} until the quality measurement procedure 2 error free video is fulfilled. 6. Fill in the measurement record 1 the C/N_{input} value defined as $C/N_{receiver}$. Later in this test procedure the value $C/N_{receiver}$ is used for rescaling of the BER_ SQI_{min} and BER_ SQI_{max} values. 7. Decrease the C/N_{input} in 1dB step starting from highest value in measurement record 2. 8. Fill in the displayed SQI in the measurement record 2. 9. Repeat the test for the DVB-T mode {8K, 64QAM, R=3/4, $\Delta/T_U=1/4$} and signal bandwidth 8MHz. 10. Do the calculations in the rest of the test procedure. |

Calculation for minimum SQI value:

11. Calculate $C/N_{\text{rel_error_min}}$ for all C/N_{input} values using formula
 $C/N_{\text{rel_error_min}} = C/N_{\text{rel}} - 1$
12. Calculate $\text{CNR_SQI}_{\text{min}}$ for all C/N_{input} values using formula
 $\text{CNR_SQI}_{\text{min}} = 0$, if $C/N_{\text{rel_error_min}} < -7$ dB
 $\text{CNR_SQI}_{\text{min}} = [(C/N_{\text{rel_error_min}} - 3)/10] + 1$, if -7 dB $\leq C/N_{\text{rel_error_min}} < 3$ dB
 $\text{CNR_SQI}_{\text{min}} = 1$, if $C/N_{\text{rel_error_min}} \geq 3$ dB
13. Calculate $\text{BER_SQI}_{\text{min}}$ for all C/N_{input} values using formula
 $\text{BER_SQI}_{\text{min}} = 19.0 * [C/N_{\text{rel_error_min}} - (C/N_{\text{receiver}} - X) + 3.6]$,
where $X = 16.2$ (64QAM R2/3)
 $X = 17.4$ (64QAM R3/4)
if resulted $\text{BER_SQI}_{\text{min}} < 20$ then set $\text{BER_SQI}_{\text{min}} = 0$
if resulted $\text{BER_SQI}_{\text{min}} > 100$ then set $\text{BER_SQI}_{\text{min}} = 100$.
14. Calculate SQI_{min} using formula
 $\text{SQI}_{\text{min}} = \text{CNR_SQI}_{\text{min}} * \text{BER_SQI}_{\text{min}}$
15. Fill in the SQI_{min} values in the measurement procedure 2.

Calculation for maximum SQI value:

16. Calculate $C/N_{\text{rel_error_max}}$ for all C/N_{input} values using formula
 $C/N_{\text{rel_error_max}} = C/N_{\text{rel}} + 1$
17. Calculate $\text{CNR_SQI}_{\text{max}}$ for all C/N_{input} values using formula
 $\text{CNR_SQI}_{\text{max}} = 0$, if $C/N_{\text{rel_error_max}} < -7$ dB
 $\text{CNR_SQI}_{\text{max}} = [(C/N_{\text{rel_error_max}} - 3)/10] + 1$, if -7 dB $\leq C/N_{\text{rel_error_max}} < 3$ dB
 $\text{CNR_SQI}_{\text{max}} = 1$, if $C/N_{\text{rel_error_max}} \geq 3$ dB
18. Calculate $\text{BER_SQI}_{\text{max}}$ for all C/N_{input} values using formula
 $\text{BER_SQI}_{\text{max}} = 19.0 * [C/N_{\text{rel_error_max}} - (C/N_{\text{receiver}} - X) + 3.6]$,
where $X = 16.2$ (64QAM R2/3)
 $X = 17.4$ (64QAM R3/4)
if resulted $\text{BER_SQI}_{\text{max}} < 20$ then set $\text{BER_SQI}_{\text{max}} = 0$
if resulted $\text{BER_SQI}_{\text{max}} > 100$ then set $\text{BER_SQI}_{\text{max}} = 100$.
19. Calculate SQI_{max} using formula
 $\text{SQI}_{\text{max}} = \text{CNR_SQI}_{\text{max}} * \text{BER_SQI}_{\text{max}}$
20. Fill in the SQI_{max} values in the measurement procedure 2.

Expected result:

All the test result are OK.

The signal quality indicator is updated regularly once per second.

Test result(s)

Measurement record 1:

| Test Case | Task 3:15 Changes In Modulation Parameters |
|-----------|--|

| | |
|---|---|
| Section | NorDig Unified 3.4.5 |
| Requirement | <p>The terrestrial NorDig IRD should recover from changes in modulation parameters at the end of a superframe without a break in the received DVB-T signal and output an error free TS. This should take less than one second for any change. The NorDig IRD should be able to detect a change of modulation parameters signalled in the TPS data of the DVB-T signal, in order to reduce the recovery time.</p> <p>The terrestrial NorDig IRD should recover from changes in modulation parameters occurring at any time followed by a break in the received DVB-T signal and output an error free TS. This should take less than four seconds for any change.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify that receiver can recover from changes in modulation parameter occurring at any time followed by a break in the received DVB-T signal and output an error free TS.</p> <p>.</p> <p>Equipment:</p>  <p>The DVB-T modulator shall have a bitrate adaptation to test this test, or, alternatively the TS source shall have capability to change the output transport stream bitrate to correspond the DVB-T mode. See bitrates in chapter 2.3.3.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Set up the instruments. 2. Use frequency 666 MHz (K45). 3. Set the RF input level to receiver to -50dBm. 4. Set up DVB-T mode 8k 64QAM R3/4 G1/4 and signal bandwidth 8 MHz in DVB-T modulator. 5. Verify that the switch is closed. 6. Check picture quality using the quality measurement procedure 1 (QMP1). 7. Open the switch to break the received RF signal 8. Change DVB-T mode to the next mode in the measurement record 9. Wait for the DVB-T modulator output to become valid and stable with this new mode (this time is modulator specific) 10. Close the switch to enable the RF signal to the receiver and record the time taken to achieve QMP1 11. Fill in the measurement record. 12. Repeat steps 7-11 for the rest of the DVB-T modes defined in the measurement record. |

| | Expected result: The receiver can recover from changes in modulation parameter occurring at any time followed by a break in the received DVB-T signal and output an error free TS within 4 seconds (excluding modulator stabilization time) without requiring a channel scan. | | | | | | | | | | | | | | | | |

| Test Case | Task 3:18 Performance: BER vs C/N verification |
| Section | NorDig Unified 3.4.10.2 |
| Requirement | Verify the internal BER measurement of the NorDig IRD for objective measurements (QMP ³²). |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |

Test procedure

Purpose of test:

To check that the internal BER value measured by the receiver to reference BER value in a function of C/N on Gaussian channel is correct.

Equipment:

Reference BER in a function of the C/N on Gaussian channel.

Test procedure:

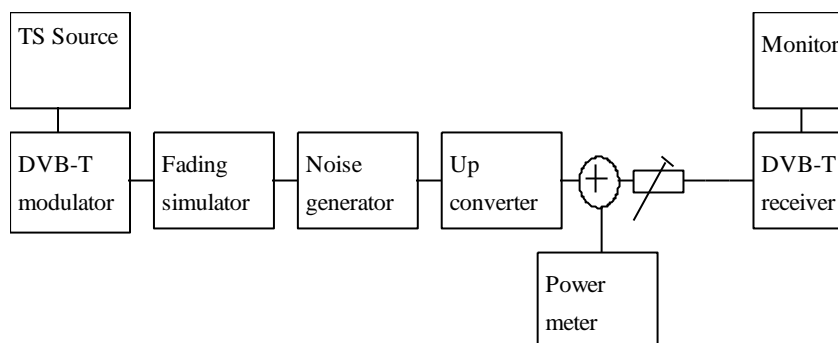

1. Setup the instruments.
2. Use channel 45 and DVB-T mode 8k 64QAM R3/4 G1/4. Set the RF input level to -50dBm .
3. Use the quality measurement procedure 2.
4. Compare the BER measured by the receiver to reference BER in a function of the C/N measurement on Gaussian channel.
5. Fill in the BER value in measurement record.
6. Adjust the required C/N that it corresponds BER $2\text{E-}4$ after viterbi.
7. Decrease the required C/N by 1dB. Check that it corresponds approximately BER $2\text{E-}3$ after viterbi and QMP1.

Expected result:

The measured BER in a function of required C/N shall have the same slope as with the reference BER in a function of required C/N.

| | The decrease of the required C/N corresponding BER 2E-4 after Viterbi by 1dB shall result approximately to BER 2E-3 after Viterbi corresponding QMP1. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|---|---|
| Test Case | Task 3:19 Performance: C/N performance on Gaussian channel |
| Section | NorDig Unified 3.4.10.3 |
| Requirement | The NorDig IRD shall have a QEF performance for the C/N ratios given in Table 3.109, or better performance. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To test the required C/N for quasi error free reception in Gaussian channel.</p> <p>Equipment:</p> |

Test procedure for Gaussian channel:

16. Set up the test instruments
17. Use the following mode {8K, 64QAM, R=2/3, $\Delta/T_U=1/8$ }
18. Set the up-converter to channel 21
19. Measure the input level to the attenuator.
20. Determine the attenuation of the attenuator and the cables.
21. Calculate the receiver input signal level and set it to -50dBm .
22. Use the value for the required C/N specified for the DVB-T mode in table 3.109.
23. Do the channel search.
24. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) fulfils.
25. Fill in the measured value in dB in the measurement record.
26. Repeat the test for the rest of the frequencies, signal bandwidths and DVB-T modes defined in the measurement record.

Expected result:

The required C/N for quasi error free reception in gaussian channel is less than specified in table 3.109.

Table 2. Optional frequencies and signal bandwidths to support.

| | |
|---|--|
| Test Case | Task 3:22 Performance: Minimum IRD Signal Input Levels on 0dB echo channel |
| Section | NorDig Unified 3.4.10.4 |
| Requirement | The NorDig IRD shall have at least the performance for the signal input level for the supported frequency range and should have a performance which is 1dB better than specified as in Table 3.13. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | Purpose of test: To verify the sensitivity of the receiver on frequency selective channel. Equipment: |

The 0 degree channel center shall be used in fading simulator (see 2.3.4) 0dB echo.

Be careful in impedance matching of cables, adapters and etc.

The 0dB echo profile must be activated when measuring the power level of the signal.

Test procedure for the sensitivity on the frequency selective channel:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments
2. Use the following DVB-T mode {8K, 64QAM, R=2/3, $\Delta/T_U=1/8$ } and signal bandwidth 8MHz.
3. Set the up-converter to frequency 666.0 MHz (K45).
4. Set the fading simulator to 0dB echo profile. (Delay 1.95us, 0 degree phase at channel center and attenuation 0dB for the second path.)
5. Determine the attenuation of the attenuator and the cables.
6. Measure the input level to the attenuator.
7. Calculate the receiver input signal level.
8. Increase the received input level from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
9. Fill in the measured value in the measurement record.
10. Verify that the channel search finds the services on measured minimum input signal level.
11. Repeat the test for the rest of the DVB-T modes on the measurement record.
12. Set the up-converter to frequency 198.5 MHz (K8) and signal bandwidth to 7MHz.
13. Repeat the test for the rest of the DVB-T modes in the measurement record.

(Measurement can be done by changing the modulation/code rate first and after that echo delay depending of the measurement equipment).

Expected result:

Required minimum signal level shall be equal or lower in dBm than specified in table 3.13on measured frequencies, DVB-T modes and signal bandwidths for all echo delays..

Test result(s)

| Test Case | Task 3:24 Performance: Maximum Receiver Signal Input Levels |
| Section | NorDig Unified 3.4.10.5 and 3.4.10.6 |
| Requirement | <p>The receiver shall provide QEF reception for DVB-T signals up to a level of -35dBm.</p> <p>The maximum analogue TV signal level is restricted to -20dBm defined as the r.m.s (root mean square) value of the vision carrier at peaks of the modulated envelope.</p> <p>The DVB-T signal level is valid for the modes {8K, 64-QAM, $R=2/3$, $\Delta/T_u=1/8$}, {8K, 64-QAM, $R=2/3$, $\Delta/T_u=1/4$} and {8K, 64-QAM, $R=3/4$, $\Delta/T_u=1/4$}.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To test that the receiver is able to handle RF signals with high value.</p> <p>Equipment:</p>  <p>Test procedure</p> <ol style="list-style-type: none"> 1. Set up the test instruments. 2. Determine the attenuation of the attenuator. 3. Use the following mode {8K, 64-QAM, $R=2/3$, $\Delta/T_u=1/8$}. 4. Set the up-converter to channel 45. 5. Determine the attenuation of the attenuator and the cables. 6. Turn on the receiver. 7. Check that the picture is decoded correctly. 8. Calculate the receiver input signal level as a function of attenuation in attenuator. 9. Increase the receiver input signal level. until the quality measurement procedure 1 (QMP1) is fulfilled. 10. Fill in the result in the measurement record. 11. Repeat the test for the modes {8K, 64-QAM, $R=2/3$, $\Delta/T_u=1/4$} and {8K, 64-QAM, $R=3/4$, $\Delta/T_u=1/4$}. |

| | Expected result: The reception shall be QEF for input level higher than or equal to -35dBm for defined DVB-T modes. | | | | | | | | | | | | |

| Test Case | Task 3:25 Performance: Immunity to “digital” signals in Other Channels |
| Section | NorDig Unified 3.4.10.67.4 |
| Requirement | <p>The NorDig IRD shall, for the supported frequency ranges, permit an interfering DVB-T signal with a minimum interference to signal level ratio (I/C) as stated in table 3.156 while maintaining QEF reception.</p> <p>The requirements in this paragraph refer to the modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$} and {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$} and {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$}</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the QEF reception when there is interference from DVB-T signal on adjacent or other channels.</p> <p>Equipment:</p>  <pre> graph LR subgraph Channel_A [Channel A] M2S1[MPEG-2 source] --> DM1[Data MUX 1] DM1 --> DTM1[DVB-T modulator] DTM1 --> UC1[Up-converter] end subgraph Channel_B [Channel B] M2S2[MPEG-2 source] --> DM2[Data MUX 2] DM2 --> DTM2[DVB-T modulator] DTM2 --> UC2[Up-converter] end UC1 --> J1(()) UC2 --> J1 J1 --> DTR[DVB-T Receiver] DTR --> MON[Monitor] </pre> |

Verify that the digital TV signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.

Test procedure:

1. Set up the test instruments
2. Use the following DVB-T mode {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$ } and signal bandwidth 8MHz.
3. Set the channel A up-converter to 666.0MHz (K45).
4. Set the channel B up-converter to 674.0MHz (K46).
5. Set the receiver input level for the DVB-T signal in channel B to -30 dBm.
6. Decrease the DVB-T signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.
7. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
8. Repeat the test when the channel B up-converter is set to frequencies 658.0 MHz (K44), 650.0 MHz (K43), 682.0 MHz (K47).
9. Repeat the test according to procedure above for the image channel¹⁾. Set the receiver input level for the DVB-T signal in channel B to -30dBm.
10. Repeat the test for the DVB-T modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$ } and {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ } using signal bandwidth 8MHz,
11. Change the signal bandwidth to 7MHz.
12. Set the channel A up-converter to frequency 198.5 MHz (K8).
13. Set the channel B up-converter to frequency 205.5 MHz (K9).
14. Set the receiver input level of the DVB-T signal in channel B to -30dBm.
15. Decrease the DVB-T signal level in channel A to a signal level when the quality measurement procedure 2 is fulfilled.
16. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
17. Repeat the test when the channel B up-converter is set to frequencies 191.5 MHz (K7), 184.5 MHz (K6) and 212.5 MHz (K10).
18. Repeat the test for the DVB-T modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$ } and {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ } using signal bandwidth 7MHz,

¹⁾ Example: if intermediate frequency IF is 36.15MHz, the image channel is calculated for channel 45 as $666\text{MHz} + 2 * 36.15\text{MHz} = 738.3\text{MHz}$ which is close to channel 54.

Expected result:

The protection ratios shall be fulfilled for received signal at the requested quality level for specified DVB-T modes, signal bandwidths and supported frequencies.

| Test Case | Task 3:26 Performance: Immunity to “LTE 700 MHz” signals in Other Channels | | |
| Section | NorDig Unified 3.4.10.7.23 | | |
| Requirement | <p>The terrestrial NorDig IRD and IRD-T2 shall, for the supported frequency ranges, permit an interfering 4G (LTE) “700MHz” signal with a minimum interference to signal level ratio (I/C) as stated in the Table 3.17xx (1) while maintaining QEF reception.</p> <p>The power of the interfering LTE signal, both BS and UE, varies with a traffic load and traffic type. The signal power of the LTE signal is defined as the power during the active part of the time varying LTE signal, referred to as the licensed power level (I).</p> <p>The I/C values shall (1) be fulfilled for LTE signals with traffic loads from 0% to 100 % (BS) and for traffic loads from low bit rate to high bit rate (UE). Low traffic loads can be the most demanding ones. The minimum I/C requirement shall be fulfilled for -25 dBm in case of UE signals and -15dBm in case of BS signals defined as licensed power of interfering signal, at the input of the IRD.</p> <p>The requirements in this paragraph refer, for DVB-T, to following modes {FFT size, modulation, code rate, guard interval, bandwidth}; {8K, 64-QAM, R=2/3, Δ/Tu =1/8, 8MHz} and {8K, 64-QAM, R=2/3, Δ/Tu =1/4, 8MHz} and {8K, 64-QAM, R=3/4, Δ/Tu =1/4, 8MHz} and and for DVB-T2 to the modes {FFT size, modulation, pilot pattern, code rate, guard interval, bandwidth} {32KE, 256-QAM R, PP4, R=2/3, Δ/Tu =1/16, 8MHz} {32KE, 256-QAM R, PP4, R=3/5, Δ/Tu =19/256, 8MHz} {32KN, 256-QAM R, PP4, R=2/3, Δ/Tu =19/256, 7MHz} and</p> | | |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD | | |
| Test procedure | <p>Purpose of test: To verify the QEF reception for LTE 700 MHz signal interference on adjacent or other channels.</p> <p>Equipment:</p> | | |

Verify that the interfering LTE signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.

From IRD point of view most demanding LTE signal might be that with low traffic load.

The LTE transmission is generated by using following LTE signal characteristics:
BS 0% traffic load (LTE_BS-idle_V3_synth.wv)
UE Video stream traffic (short_UE-Video-Stream_V2.wv)

Files in I/Q file format specified above are available on the ETSI website
http://www.etsi.org/deliver/etsi_en/303300_303399/303340/01.01.02_60/en_303340v010102p0.zip

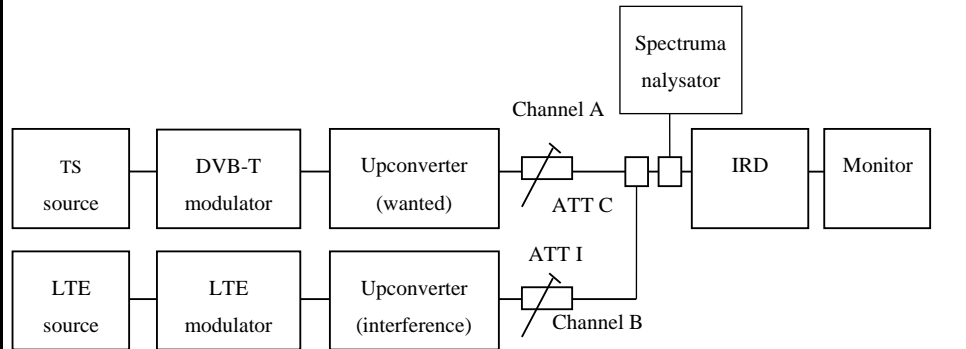

or if not available, they can be found on the NorDig homepage.

Test procedure:

1. Set up the test instruments
2. Use the following DVB-T mode {8K, 64-QAM, R=2/3, $\Delta/T_u = 1/8$, 8MHz }
3. Set the channel A up-converter to 690.0MHz (K48).
4. Set the channel B up-converter to 708.0MHz .
5. Set the LTE interferer to UE Video traffic mode.
6. Set the receiver input level for the LTE signal in channel B to -25 dBm licensed power. (Note the rms power measured on a power meter with sufficient averaging to remove the large power fluctuations in the signal will be -42.7 dBm.)
7. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.
8. Fill in the measured signal level difference between channel A and channel B (licensed power) signals in dB in measurement record.
9. Repeat the test when the channel B up-converter is set to frequencies 718.0 MHz, 728.0 MHz.
10. Set the channel B up-converter to 763.0MHz.
11. Set the LTE interferer to BS 0% traffic load mode.
12. Set the receiver input level for the LTE signal in channel B to -15 dBm licensed power. (Note the rms power measured on a power meter with sufficient averaging to remove the power fluctuations in the signal will be -23.3 dBm.)
13. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.
14. Fill in the measured signal level difference between channel A and channel B (licensed power) signals in dB in measurement record.
15. Repeat the test when the channel B up-converter is set to frequencies 773.0 MHz, 783.0 MHz.

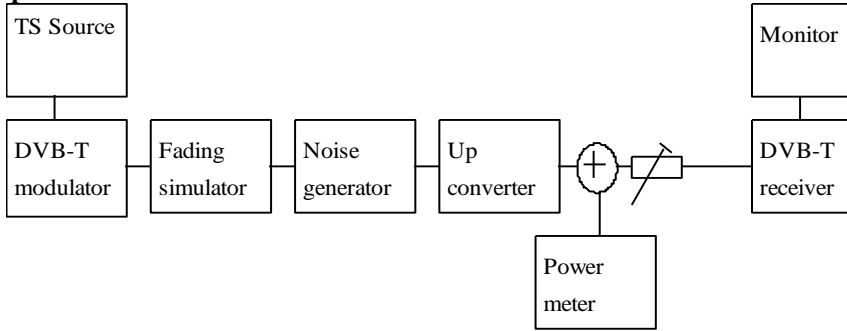

| | <p>16. Repeat the test for the DVB-T mode {8K,64-QAM,R=3/4,Δ/Tu =1/4,8MHz}.</p> <p>Expected result:</p> <p>The wanted DVB-T signal shall be QEF for the interference signal levels as specified.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 3:28 Performance: Performance in Time-Varying Channels |
| Section | NorDig Unified 3.4.10.98 |
| Requirement | <p>The NorDig IRD shall be able to operate with all signal time variations that naturally exist in connection with fixed roof-top reception (e.g. mast sway, antenna sway) and in-house portable reception (e.g. people walking around the receiving antenna). None of the above mentioned performance parameters should be significantly negatively affected when such channel time variations exist.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 20 Hz and a delay of 20 μs, corresponding to a Doppler shift of +/- 10 Hz (after AFC), compared to a 0 dB echo with frequency separation equal to 1 Hz and a delay of 20 μs, corresponding to a Doppler shift of +/- 0.5 Hz (after AFC). The requirements in this paragraph refer to the modes {8K, 64-QAM, R=2/3, $\Delta/Tu = 1/8$} and {8K, 64-QAM, R=2/3, $\Delta/Tu = 1/4$}.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 10 Hz and a delay of 20 μs, corresponding to a Doppler shift of +/- 5 Hz (after AFC), compared to a 0 dB echo with frequency</p> |

| | separation equal to 1 Hz and a delay of 20 μ s, corresponding to a Doppler shift of +/- 0.5 Hz (after AFC). The requirement in this paragraph refer to the mode {8K, 64-QAM, R=3/4, Δ/T_U =1/4}. | | | | | | | | | | |

|---|---|
| Test Case | Task 3:29 Performance: Synchronisation for varying echo power levels in SFN |
| Section | NorDig Unified 3.4.10.499 |
| Requirement | For the modes {8K, 64-QAM, R=2/3, $\Delta/T_U = 1/8$ }, {8K, 64-QAM, R=2/3, $\Delta/T_U = 1/4$ } and {8K, 64-QAM, R=3/4, $\Delta/T_U = 1/4$ }, the required C/N value (specified in Table 3.18) for subjective error free reception shall be obtained when the channel contains two paths with relative delay from 1.95 μ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | Purpose of test: To verify the SFN synchronisation when the amplitude of the echo compared to the amplitude of the direct signal varies in a function of time. Equipment: |

The 0 degree channel center shall be used in fading simulator (see 2.3.5).

Test procedure for variations of the echo attenuation in a function of time:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

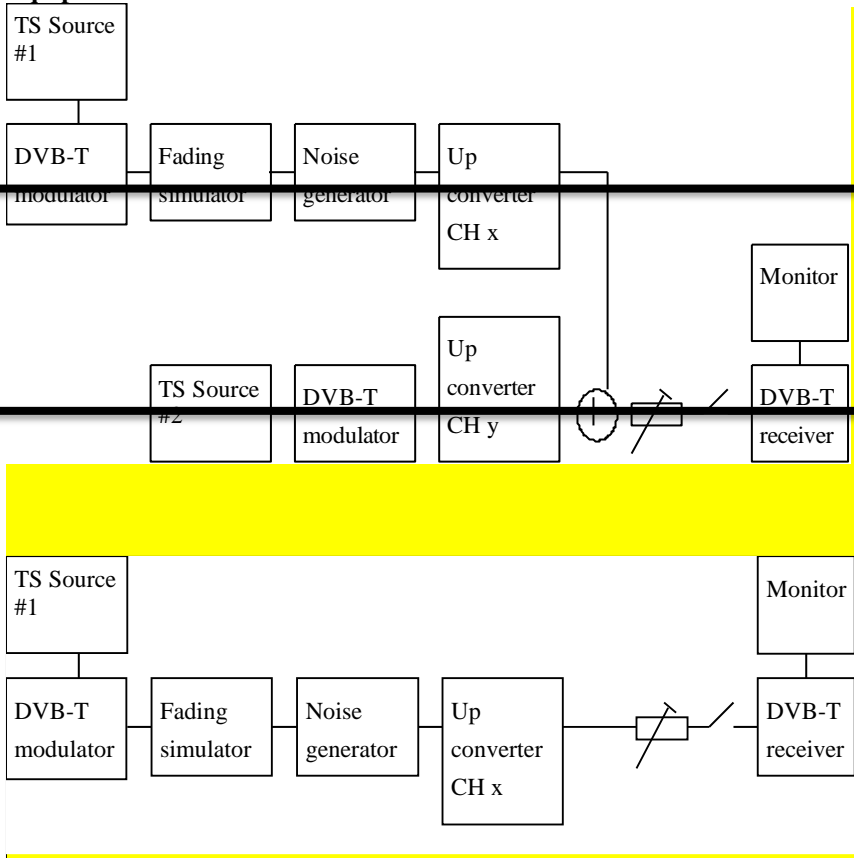

1. Set up the test instruments.
2. Use the following mode {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ }.
3. Open the switch.
4. Configure the first path signal (direct) with following parameters: 0dB attenuation and 0 μ s delay.
5. Configure the second path signal (1st echo) with following parameters: 0dB attenuation and first delay value from the measurement record. .
6. Set the receiver input level to -50 dBm.
7. Configure the third path signal (2nd echo) with following parameters: 1dB attenuation and delay same as for the second path and 0.1Hz frequency separation.
8. Close the switch.
9. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the measured required C/N value in dB in the measurement record.
11. Repeat the test for the rest of the echo delay values in the measurement record following the procedure above. Between change of the echo delay, RF input signal to the receiver shall be disconnect.
12. Repeat the test for the DVB-T modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$ } and {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$ }.

Expected result:

The IRD shall maintain the SFN synchronisation when the amplitude of the echo signal varies in a function of time. The required C/N shall not exceed the specified value in table 3.18.

| Test Case | Task 3:30 Performance: C/(N+I) Performance in SFN for more than one echo |
| Section | NorDig Unified 3.4.10.1 40 |
| Requirement | <p>If there exists one or more FFT window positions for the time synchronisation that will give an aggregate available C/(N+I) larger than or equal to the required EPT (Effective Protection Target), the NorDig IRD shall be able to find one of these positions, independently of echo profile. The NorDig IRD shall also be able to correctly equalise the signal for echoes up to $7T_u/24$ (260 μs) (Interval of correct equalisation), independently of the echo profile.</p> <p>EPT = Effective Protection Target</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the SFN synchronization of the receiver when two echo signals are present.</p> <p>Equipment:</p>  |

The 0 degree at channel center shall be used in fading simulator (see 2.3.5).

Test procedure:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following DVB-T mode {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ } and signal bandwidth 8MHz.
3. Open the switch.
4. Configure one path of the channel simulator to have a 0dB attenuation, 0 μ s delay and 0 degree phase.
5. Configure the second path of the channel simulator to have relative delay difference -100.1 μ s and attenuation 21dB (pre echo) and 0 degree phase.
6. Configure the third path of the channel simulator to have relative delay difference +100.0 μ s and attenuation 15 dB (post echo) and 0 degree phase.
7. Set the receiver input level to -50 dBm.
8. Close the switch.
9. Increase the required C/N value from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the required C/N value in dB in the measurement record.
11. Measure the rest of the required C/N values starting at the bottom of the table and upward.
12. Fill in the results in the measurement record. During the change of the delay and the attenuation, the input RF signal to receiver shall be disconnected.
13. Repeat the test for the DVB-T mode {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$ }.
14. Repeat the test for the DVB-T mode {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$ }.

Expected result:

The IRD shall synchronize in all combinations defined in measurement record and the required C/N value shall not exceed the required C/N defined for profile 2: 0dB echo in table 3.109.

Test result(s)

| Test Case | Task 3:31 Performance: C/(N+I) Performance in SFN inside the guard interval |
| Section | NorDig Unified 3.4.10.1011 |
| Requirement | <p>For the modes {8K, 64-QAM, R=2/3, $\Delta/T_u=1/8$}, {8K, 64-QAM, R=2/3, $\Delta/T_u=1/4$} and {8K, 64-QAM, R=3/4, $\Delta/T_u=1/4$}, the required C/N value for profile 2 (specified in Table 3.10) for QEF reception shall be obtained when the channel contains two static paths with relative delay from 1.95 μs up to 0.95 times guard interval length, independently of the relative amplitudes and phases of the two paths.</p> <p>For specific echo attenuation, the required C/N shall not be more than 1 dB higher compared to the median value when calculated for the required C/N values over the echo delays from 1.95 μs up to 0.95 times guard interval length.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the required C/N for echoes in SFN inside the guard interval.</p> <p>Equipment:</p> |

The 0 degree channel center shall be used in fading simulator (see 2.3.5).

Test procedure for required C/N in SFN for echoes inside guard interval:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following DVB-T mode {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ } and signal bandwidth 8MHz.
3. Set the up-converter to center frequency 666MHz (K45).
4. Open the switch.
5. Set the receiver input level to -50 dBm for the wanted signal.
6. Set the channel simulator relative delay difference to 1.95 us for the echo signal.
7. Set the channel simulator relative attenuation level to 0 dB for the echo signal.
8. Set C/N to such a ratio that receiver is unlocked state and reception is not possible.
9. Close the switch.
10. Increase the C/N value until the quality measurement procedure 2 (QMP2) is fulfilled.
11. Fill in the required C/N value in dB in the measurement record.
12. Measure the rest of the required C/N values for the negative and positive 0dB echoes. Fill in the results in the measurement record. During the change of the delay the input RF signal shall be disconnected.
13. Test the rest of the combinations (not marked grey) of the relative delays and attenuation levels. The delay of the echo is maintained constant when the change of the attenuation from 21dB to 1dB is done. Find the required C/N

2.3.9.2 Test cases – DVB-T2

| | |
|---|--|
| Test Case | Task 3:33 DVB-T2: Frequencies: Center frequencies |
| Section | NorDig Unified 3.4.2.2 |
| Requirement | <p>The front-end shall for the supported frequency ranges be capable of tuning to the center frequency f_c of the incoming DVB-T/T2 RF signal, see below and NorDig Specification :</p> <p><u>8 MHz raster:</u> $f_c = 114 \text{ MHz} + K * 8 \text{ MHz}$, where K is an integer number, running from 0 to 9384.</p> <p><u>7 MHz raster:</u> $f_c = 107.5 \text{ MHz} + L * 7 \text{ MHz}$, where L is an integer number, running from 0 to 27.</p> <p><u>1.7 MHz raster (DVB-T2):</u> f_c shall be as specified in Annex B2.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the reception over the supported frequency range.</p> |

Equipment:

Use following DVB-T2 modes:

- VHF III 1.7 MHz signal bandwidth: 8k normal bandwidth, 64QAM rotated, G1/8, PP2, R3/4, L1-ACE & TR PAPR
- VHF III 7 MHz signal bandwidth: 32k normal bandwidth, 256QAM rotated, G1/8, PP2, R3/4, L1-ACE & TR PAPR
- VHF S I and S II, III and UHF S III 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, G1/16, PP4, R2/3, L1-ACE & TR PAPR
- UHF IV/V 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, G1/16, PP4, R2/3, L1-ACE & TR PAPR

Test procedure:

1. Set up the test instruments
2. Use the corresponding DVB-T2 mode from list above.
3. Use input level of -50 dBm
4. Start with frequency 177.5 MHz (K5)
5. Use the quality measurement procedures 1 (QMP1)
6. Fill the result in the measurement record: **OK** or **NOK**.
7. Repeat the test for all channels in the table 1 and table 2 in the measurement record.
8. If the receiver supports optional frequency ranges, test all remaining channels in table 3 and 4 in the measurement record.

Expected result:

The result of the test shall be OK for all channels in table 1 in test results.

Test result(s)

| Test Case | Task 3:34 DVB-T2: Frequencies: Frequency offset |
| Section | NorDig Unified 3.4.2.3 |
| Requirement | The NorDig IRD shall be able to receive signals with an offset of up to 50kHz from the nominal frequency. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | Purpose of test: To verify that the reception is possible in specified frequency offset from nominal frequency. Equipment: |

Use following DVB-T2 modes:

- VHF III 1.7 MHz signal bandwidth: 8k normal bandwidth, 64QAM rotated, G1/8, PP2, R2/3, L1-ACE & TR PAPR
- VHF III 7 MHz signal bandwidth: 32k normal bandwidth, 256QAM rotated, G1/8, PP2, R3/4, L1-ACE & TR PAPR
- UHF IV/V 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, G1/16, PP4, R2/3, L1-ACE & TR PAPR

Test procedure:

1. Set up the test instruments
2. Set the center frequency to 177.5 MHz and frequency offset to 0 kHz. Use signal bandwidth 7MHz.
3. Use the corresponding DVB-T2 mode from the list above.
4. Use input level of -50 dBm
5. Connect receiver and do the channel search if needed.
6. Test with the specified frequency offset values in the measurement record. Before changing the frequency offset, disconnect the receiver from the received RF signal.
7. Do the change of frequency offset,
8. Connect the received RF signal back to the receiver.
9. Use the quality measurement procedure 1 (QMP1)
10. Fill the result in the measurement record: **OK** or **NOK**.
11. Test the remaining frequency offset values on specified center frequencies and signal bandwidths in the measurement record.

Expected result:

The test shall be OK for all frequency offset values on specified center frequencies and signal bandwidths in table 1 in test results.

Test result(s)

| Test Case | Task 3:35 DVB-T2: Frequencies: Signal bandwidths |
| Section | NorDig Unified 3.4.2.4 |
| Requirement | <p>The NorDig IRD for DVB-T2 shall support both the normal and extended carrier modes.</p> <p>The NorDig IRD for DVB-T2 shall follow network parameter change from normal to extended carrier mode and vice versa automatically without any need for user action.</p> <p>VHF Bands:</p> <p style="padding-left: 40px;">The NorDig IRD shall (1) for the supported frequency ranges be able to receive 7 MHz and should be able to receive 8 MHz DVB-T/T2 signals. If 8 MHz bandwidth is supported it shall automatically detect which DVB-T/T2 signal bandwidth is being used, and it shall be possible to receive the 8 MHz DVB-T/T2 signals on the 7 MHz channel frequency raster.If 1.7 MHz bandwidth is supported the NorDig IRD-T2 shall automatically detect which DVB-T/T2 signal bandwidth is being used.</p> <p>UHF Bands:</p> <p style="padding-left: 40px;">The NorDig IRD shall for the supported frequency ranges be able to receive 8 MHz DVB-T/T2 signals.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the receiver is able to automatically detect the transmitted signal bandwidth and do the required adaptations for QEF reception.</p> <p>Equipment:</p> <div><div>TS source</div><div>DVB-T2 exciter</div><div>DVB-T2 receiver</div></div> <p>Use following DVB-T2 modesin single PLP mode:</p> <ul style="list-style-type: none">VHF III 1.7 MHz signal bandwidth: 8k normal bandwidth, 64QAM rotated, G1/8, PP2, R2/3, L1-ACE & TR PAPR |

- VHF III 7 MHz signal bandwidth: 32k normal or extended bandwidth, 256QAM rotated, GI19/256, PP2, R2/3, L1-ACE & TR PAPR
- VHF III 8 MHz signal bandwidth: 32k extended bandwidth, 256QAM rotated, GI19/256, PP2, R3/5, L1-ACE & TR PAPR
- UHF IV/V 8 MHz signal bandwidth: 32k normal or extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE & TR PAPR

Test procedure:

1. Set up the test instruments.
2. Use the transmission frequency UHF IV/V 666 MHz (K45) and an input level of -50 dBm to the receiver. Select corresponding DVB-T2 mode from list above.
3. Connect the receiver and perform an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.
4. Use the quality measurement procedure 1 (QMP1).
5. Fill the result in the measurement record: **OK** or **NOK**.
6. Change the transmission frequency to VHF III channel 198.5 MHz (K8) and signal bandwidth to 7 MHz. Select corresponding DVB-T2 mode from list above.
7. Verify that the channel list does not have any services installed by performing initialization to factory defaults or in such way.
8. Do an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.
9. Use the quality measurement procedure 1 (QMP1).
10. Fill the result in the measurement record: **OK** or **NOK**.
11. If receiver supports 1.7MHz signal bandwidth in VHF III, change the transmission frequency to VHF III channel 209.936 MHz (10A) and signal bandwidth to 1.7 MHz. Select corresponding DVB-T2 mode from list above.
12. Verify that the channel list does not have any services installed by performing initialization to factory defaults or in such way.
13. Do an automatic or manual channel search. The signal bandwidth initialization shall not be required by the user.
14. Use the quality measurement procedure 1 (QMP1).
15. If receiver supports 8MHz signal bandwidth in VHF III, change the transmission frequency to VHF III channel 198.5 MHz (K8) and signal bandwidth to 8 MHz. Select corresponding DVB-T2 mode from list above.

Expected result:

The test results shall be OK for all tests in the table 1 and table 2 in the measurement record and user does not have to initialize the signal bandwidth for the succesfull channel search and QEF reception.

If 1.7MHz signal bandwidth in VHF is supported the test result shall be OK for the test in the table 3 in the test results.

If 8MHz signal bandwidth in VHF is supported the test result shall be OK for the test in the table 3 in the test results.

| Test Case | Task 3:36 DVB-T2: Modes |
| Section | NorDig Unified 3.4.3 |
| Requirement | <p>The NorDig IRD-T2 shall be capable of correctly demodulating all allowed configurations, or “DVB-T2 modes”, as specified in EN 302 755, with the following exceptions:</p> <ul style="list-style-type: none"> Support for 1.7 MHz bandwidth is optional Support for Time Frequency Slicing (TFS) is optional. Support for 10 MHz bandwidth is not required Support for PLPs carrying GS/GSE is not required Support for Transmission modes 16K and 32K, when 1.7 MHz RF bandwidth is supported, is not required <p>The existence of transmissions using configurations that the NorDig IRD-T2 is not required to support shall not cause the NorDig IRD-T2 to malfunction.</p> <p>When TFS is supported the following shall apply: For 8MHz DVB-T2 signals with modulation parameters {32K, 256-QAM, CR=3/5, GI=1/16} on all data PLPs the NorDig IRD-T2 shall support reception of variable-bit rate PLPs in TFS with a TS peak data rate of up to 15 Mbps using up to six RF frequencies. Each TS is split into one data PLP and a common PLP.</p> <p>The NorDig IRD shall automatically detect which mode is being used.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the reception of subset of all possible DVB-T2 modes.</p> |

TFS support is not tested.

MISO support is not tested.

FEC frame length 16200 is not tested.

Input Mode B is not tested.

Normal mode (NM) is not tested.

Extended and normal carrier modes are tested in test Task 3:36 DVB-T2 Frequencies: Bandwidth

Equipment:

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks:

| | |
|------------------|--------|
| Carrier mode | Normal |
| Signal bandwidth | 8MHz |

Test procedure:

1. Set up the test instruments.
2. Use channel K45 (666MHz) and an input level of -50 dBm.
3. Test all the DVB-T2 parameter combinations listed in tables in test results using the quality measurement procedure 1 (QMP1).
4. Fill the result in the measurement record: **OK** or **NOK**.

Expected result:

The test shall be OK for all tested DVB-T2 mode parameter listed in test result tables.

| Test Case | Task 3:37 DVB-T2: MISO |
| Section | NorDig Unified 3.4.3 |
| Requirement | Within the NorDig IRD specification the concept of “DVB-T2 mode” includes e.g. (the list is not exhaustive): <ul style="list-style-type: none"> SISO/MISO |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | Purpose of test: To verify that the receiver fully supports the expected advantages of MISO transmissions modes in SFN. Equipment: |

T2MI source shall have a TS containing at least one service.

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks:

| | |
|-----------|------|
| SISO/MISO | MISO |
|-----------|------|

Both DVB-T2 exciters must be locked to same reference signals as well as run in the SFN mode.

Test procedure:

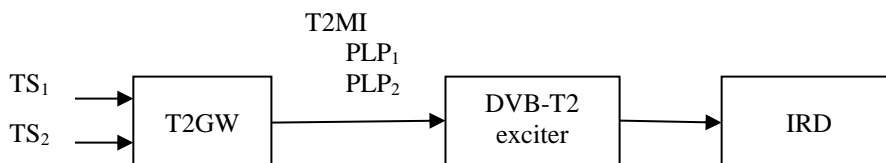

First verify reception in Gaussian like channel when exciters are in MISO modes with different group settings.

1. Set up the test instruments
2. Set the channel A to 666.0MHz (K45).
3. Set the channel B to 666.0MHz (K45).
4. Set the DVB-T2 exciter in channel A to MISO group 1 mode with parameters 8 MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR, $L_f=62$.
5. Set the DVB-T2 exciter in channel B to MISO group 2 mode with parameters 8MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR, $L_f=62$.
6. Set the receiver input level for the DVB-T2 signal in channel A to -50 dBm. Attenuate the input signal from channel B so that it is not able to be received.
7. Adjust the noise power to a level corresponding 30dB signal-to-noise ratio.
8. Verify the service carried on channel A is able to be received and decoded correctly using quality measurement procedure 1(QMP1).
9. Fill in **NOK** or **OK** in measurement record.
10. Increase the attenuation for the channel A so that it is not any more able to be received.
11. Decrease the attenuation for the channel B. Adjust the receiver input level to -50dBm.
12. Verify the service carried on channel B is able to be received and decoded correctly using quality measurement procedure 1 (QMP1).
13. Fill in **NOK** or **OK** in measurement record.

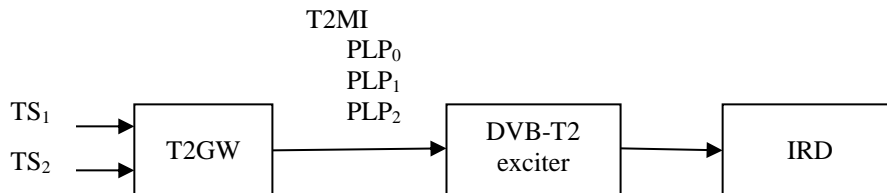

Secondly verify reception in SFN like channels in MISO modes with different group settings.

14. Set the DVB-T2 exciter in channel A to MISO group 1 mode with parameters 8 MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR, $L_f=62$.

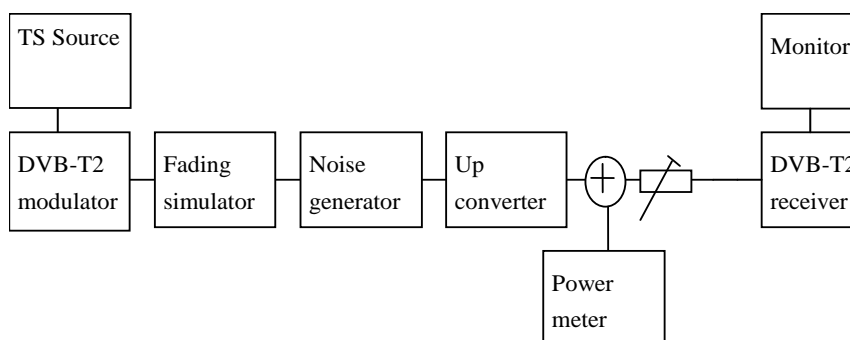

| | <ol style="list-style-type: none"> 15. Set relative delay of the exciters to 10μs, adjust output levels to 0dB echo difference and verify the total output power level is -50dBm as well as noise power to a level corresponding 30dB signal-to-noise ratio. 16. Verify the service carried on channel A is able to be received and decoded correctly using quality measurement procedure 1 (QMP1). 17. Fill in NOK or OK in measurement record. 18. Set the relativedelay of the exciters to 170μs and output power level difference to 0dB. 19. Verify the service carried on channel A is able to be received and decoded correctly using quality measurement procedure 1 (QMP1). 20. Fill in NOK or OK in measurement record. <p>Thirdly verify reception in SFN like channels in MISO modes with equal group settings.</p> <ol style="list-style-type: none"> 21. Set the DVB-T2 exciters in channel A and B to MISO group 2 ¹⁾mode with parameters 8 MHz signal bandwidth, 32k extended, 256QAM rotated, GI1/16, PP2, R2/3, L1-ACE & TR PAPR, L_t= 62. 22. Set relative delay of the exciters to 10μs, adjust output levels to 0dB echo difference and verify the total output power level is -50dBm as well as noise power to a level corresponding 30dB signal-to-noise ratio. 23. Verify the service carried on is able to be received and decoded correctly using quality measurement procedure 1 (QMP1). 24. Fill in NOK or OK in measurement record. 25. Set the relative delay of the exciters to 170μs and output power level difference to 0dB. 26. Verify the service carried on is able to be received and decoded correctly using quality measurement procedure 1 (QMP1). 27. Fill in NOK or OK in measurement record. <p>¹⁾Consider reception in SFN consisting three or more transmitters. Because of group settings in exciters, reception from exciters within same group or different groups may occur.</p> <p>Expected result: The IRD is able to decode services correctly and all the test results are OK.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 3:42 DVB-T2: Input Mode B (RBM when FEF present) |
| Section | NorDig Unified 3.4.3 |
| Requirement | <p>Within the NorDig IRD specification the concept of “DVB-T2 mode” includes e.g. (the list is not exhaustive):</p> <ul style="list-style-type: none"> Input Mode A (single PLP) or Input Mode B (Multiple PLPs – Common PLP, Type 1 and 2 up to the maximum allowed figure 255) <p>DVB-T2 signal introduces a receiver buffer model (RBM) which is fundamental when it comes to receive signals where carried transport stream doesn't have constant bit rate as it is case for MPLPs and FEF.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify that received DVB-T2 signal can stress the receiver RBM regarding time deinterleaver buffer based on DVB V&V tests.</p> <p>Equipment:</p> |

Use Mode B (multiple PLP) and parameter settings defined in 2.3.7 Summary of DVB-T2 modes for NU_M4.

The DVB-T2 signal shall contain a FEF with PRBS content and with a FEF interval of 4 T2 frames.

The size of the PRBS FEF is 380000 samples and T2 frame size $L_f=28$ symbols.

T2 frames within $PLP_{id}=0$ and 3 shall carry a valid TS. TS bit rate is restricted to maximum of 3.3MBit/s.

The content within TS is maximized to bit rate the TS can carry, with other words, minimize the NULL packets in TS.

TS contains one service.

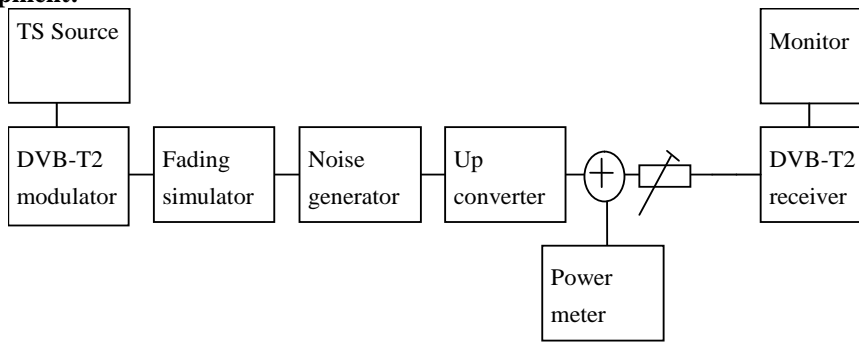

The DVB-T2 signal generation shall support DVB V&V dynamic multiple PLP models. The configuration files are available for download on NorDig homepages.

| Parameter | Description | Value |
|-----------------|--|--|
| M | Interval in packets between common PLP slots | 11 |
| L | Number of separate chapters | 10 |
| NumReps | Repeats of repeating unit | 15, 1, 15, 1, 15, 1, 15, 1, 15, 1 |
| RunLength (TS0) | Run length for TS0 in each repeating unit in a chapter | 102, 95, 102, 95, 0, 0, 66, 3, 102, 95 |
| RunLength (TS1) | Run length for TS1 in each repeating unit in a chapter | 13, 11, 13, 11, 19, 13, 8, 17, 13, 11 |
| RunLength (TS2) | Run length for TS2 in each repeating unit in a chapter | 13, 15, 13, 15, 19, 13, 8, 15, 13, 15 |
| RunLength (TS3) | Run length for TS3 in each repeating unit in a chapter | 13, 14, 13, 14, 18, 11, 7, 3, 13, 14 |

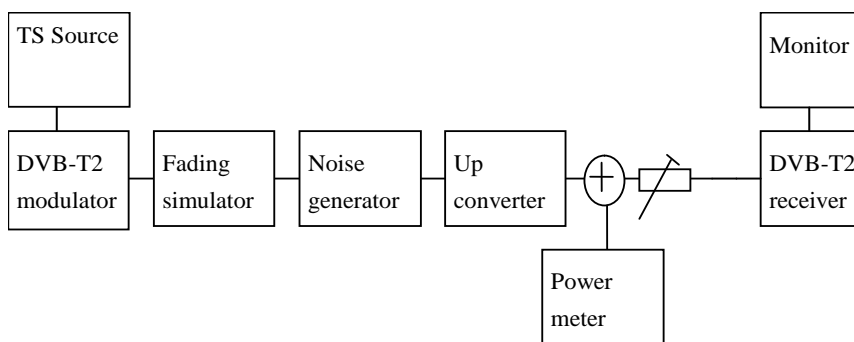

Test procedure:

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP7, $\Delta/T_U=1/128$ } and signal bandwidth 8MHz in exciter.
3. Use Gaussian channel without additional noise or interference.

| Test procedure | <p>Purpose of test: To verify that broadcasting of FEF doesn't cause any harm for the receiver.</p> <p>Equipment:</p>  <p>Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks:</p> <table border="1"> <tr> <td>ISSY</td><td>Enabled</td></tr> <tr> <td>FEF</td><td>Yes</td></tr> <tr> <td>Auxiliary streams</td><td>Not used</td></tr> <tr> <td>Frames per superframe (N_{T2})</td><td>6</td></tr> <tr> <td>FEF P1: S1 Value</td><td>2</td></tr> </table> | | | ISSY | Enabled | FEF | Yes | Auxiliary streams | Not used | Frames per superframe (N_{T2}) | 6 | FEF P1: S1 Value | 2 |
| ISSY | Enabled | | | | | | | | | | | | |
| FEF | Yes | | | | | | | | | | | | |
| Auxiliary streams | Not used | | | | | | | | | | | | |
| Frames per superframe (N_{T2}) | 6 | | | | | | | | | | | | |
| FEF P1: S1 Value | 2 | | | | | | | | | | | | |

| | |
|------------------|----------------|
| FEF P1: S2 Value | 1 |
| T2 P1:S2 Value | 1 |
| FEF size | 520000 samples |
| Design delay | 719248 samples |

The DVB-T2 signal shall contain empty FEF with a FEF interval of 6 T2 frames.

The size of the empty FEF is 520000 samples (56.875ms) and T2 frame size $L_f=62$ symbols (236.320ms). By empty FEF means FEF without content resulting to a lower RF output power during the FEF compared to T2 frame.

T2 frames shall carry a TS. TS bitrate is maximized to the capacity the T2 frame size can deliver, with other words, the number of T2 dummy cells are minimized.

The content within TS is maximized to bit rate the TS can carry, with other words, minimize the NULL packets in TS.

TS contains at least one service.

Using DVB-T2 mode specified ($L_f=62$ symbols) below allows total bit rate of 36.55190642Mbit/s. Using FEF and T2 frame size relation above, the TS bit rate is 35.14229377 Mbit/s.

Test procedure:

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP4, $R=2/3$, $\Delta/T_U=1/16$ } and signal bandwidth 8MHz in exciter.
3. Use Gaussian channel without additional noise or interference.
4. Set the receiver input level to -50 dBm.
5. Verify the received signal carrying services using quality measurement procedure 2 (QMP2).
6. Disable FEF from broadcast.
7. After possible short interruption on the received service just when FEF is disabled, the receiver shall recover by itself and continue decoding of the service.
8. Verify the received signal carrying services using quality measurement procedure 2 (QMP2).
9. Enable FEF in broadcast.
10. After possible short interruption on the received service just when FEF is enabled, the receiver shall recover by itself and continue decoding of the service.
11. Verify the received signal carrying services using quality measurement procedure 2 (QMP2).

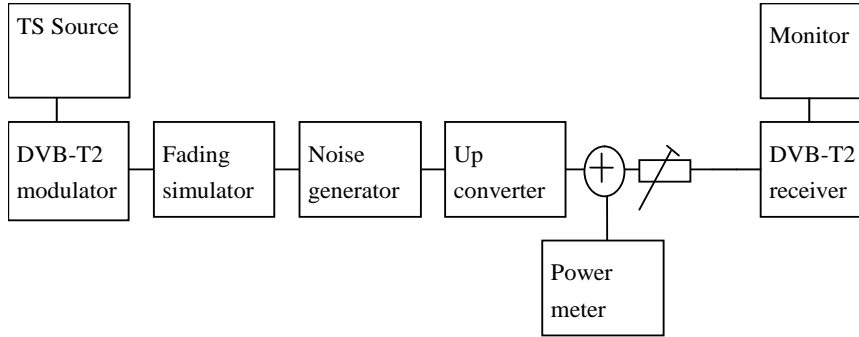

Expected result:

Broadcasting of FEF doesn't cause any harm to receiver and services carried within TS are decoded correctly.

Receiver doesn't need any actions from end user to maintain reception when FEF is disabled and enabled.

| Test Case | Task 3:46 DVB-T2: Auxiliary streams |
| Section | NorDig Unified 3.4.3 |
| Requirement | The NorDig terrestrial IRD is not required to demodulate or decode the content of FEF parts and auxiliary streams, but the existence of FEFs and/or auxiliary streams shall not cause receiver to malfunction. |
| IRD Profile(s) | Basic, IRD, DVB-T Terrestrial IRD |

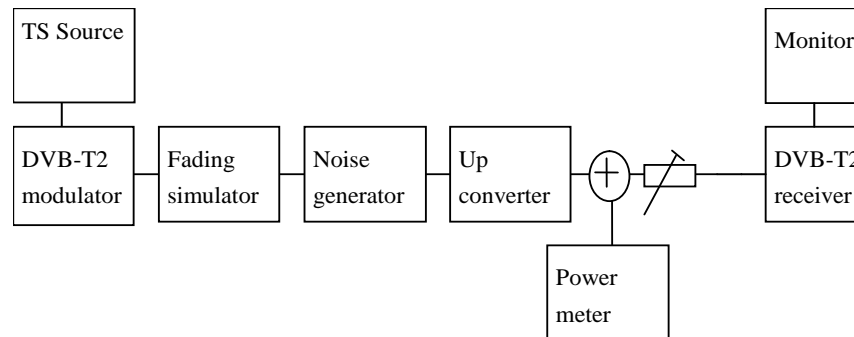

variants and capability

Test procedure

Purpose of test:

To verify that broadcasting of AUX doesn't cause any harm for the receiver.

Equipment:

Use Mode A (Single PLP) and following deviations to parameter settings defined in 2.3.7Summary of DVB-T2 modes in DVB-T2 test tasks:

| | |
|-------------------|-----|
| Auxiliary streams | Yes |
|-------------------|-----|

The DVB-T2 signal shall contain auxiliary stream in T2 dummy cells with T2 frame size of $L_f=62$ symbols. The DVB-T2 signal with specified mode parameters contains 221 dummy cells.

Auxiliary stream content is T2-TX-SIG according to specification ETSI TS 102 992. Tested receiver is not required to interpret content in the T2-TX-SIG. The T2-TX-SIG information is carried within 193 dummy cells out the available 221 dummy cells.

Configuration of T2-TX-SIG signaling is following:

$M=15$ (maximum number of transmitters signaled)

$N=8$ (number of cells per symbols and frame)

$L=15$ (repetition rate for T2 frames)

T2 frames shall carry a TS. TS bitrate should be maximized to the capacity the T2 frame size can deliver.

The content within TS is maximized to bit rate the TS can carry, with other words, minimize the NULL packets in TS.

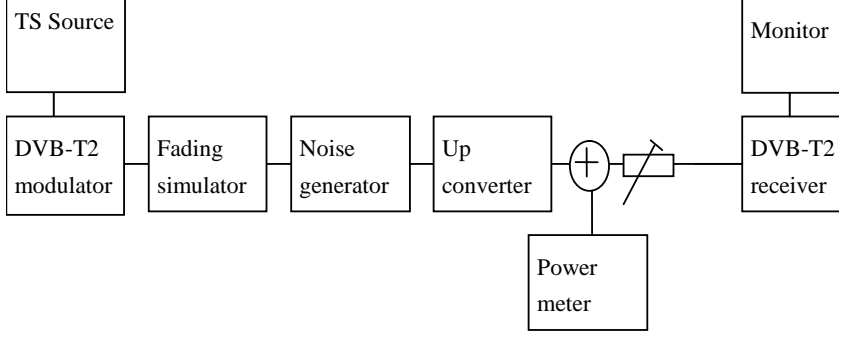

TS contains at least one service.

Test procedure:

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP4, $R=2/3, \Delta/T_U=1/16$ } and signal bandwidth 8MHz in exciter.
3. Use Gaussian channel without additional noise or interference.
4. Set the receiver input level to -50 dBm.
5. Verify the received signal carrying services using quality measurement procedure 2 (QMP2).

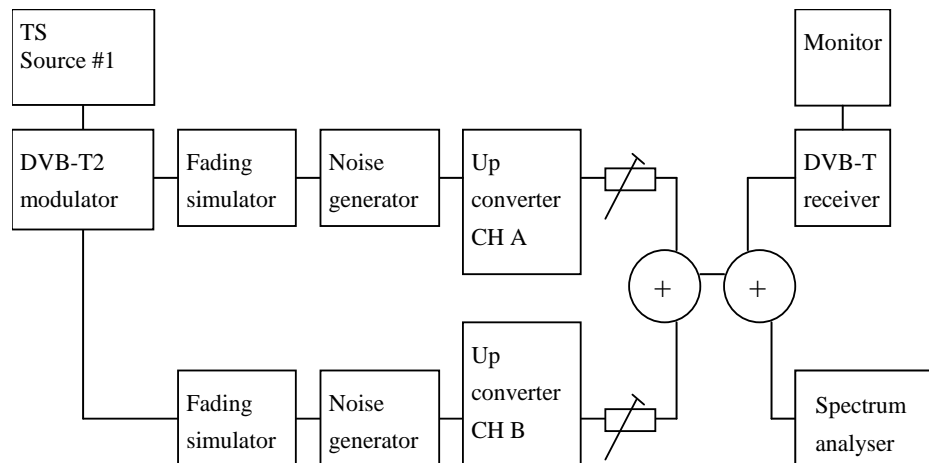

Expected result:

| | |
|-----------------------|---|
| | Broadcasting of auxiliary stream doesn't cause any harm to receiver and services carried within TS are decoded correctly. |

| Test Case | Task 3:48 DVB-T2: Tuning/Scanning Procedures: Automatic channel search for the same service bouquet |
| Section | NorDig Unified 3.4.4.4 |
| Requirement | <p>The IRD shall provide an automatic search that finds all of the multiplexes and services in the whole (supported) frequency range, see NorDig specification. The logic of the automatic search function shall be as follows:</p> <p style="padding-left: 40px;">If any services are detected during the automatic search the current service list shall be replaced by the new service list.</p> <p style="padding-left: 40px;">If no services are detected during the automatic search the current service list shall be kept or deleted.</p> <p>The IRD shall only display a service once in the service list (i.e. avoiding duplicate of the same services), even if the same service (same triplet original_network_id, transport_stream_id and service_id) is received from multiple transmitters. If the same service can be received from several transmitters, the one with best reception quality shall be selected. The criteria for selection of the best received service (i.e. best reception quality) shall be based on the combination of the signal strength and signal quality according to NorDig specification.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the best service selection in automatic channel search when the content of the transport stream is the same on several transmitters.</p> <p>Equipment:</p> |

Channels A and B

TS source #1

ONID=8945

Network ID=1000

Network Name=Net1

TSID=100

Services

| Name | SID | Logic | Ch No |
|------|-----|-------|-------|
| S1 | 1 | 1 | |
| S2 | 2 | 2 | |
| S3 | 3 | 3 | |
| S4 | 4 | 4 | |

There is a possibility to receive broadcasts from several transmitters simultaneously in DVB-T2 networks. These transmitters can have exactly the same content, but are transmitted on different channels (frequencies). Therefore, it is important that the receiver can choose by an automatic channel search the services with the best reception quality.

Test to verify broadcast where equal services are broadcasted simultaneously over DVB-T and DVB-T2 networks is not required.

Reception quality can be divided into two different parameters:

- Signal strength
- Signal quality

Signal quality can be divided into two main parameters:

- Signal-to-noise ratio (C/N)
- Bit error rate before BCH (BER before BCH in DVB-T2 system)

Channels A and B shall not be equal.

Relative signal levels can be observed on spectrum analyser.

ΔS refers to difference in SSI according to [1] Annex D.

ΔQ refers to difference in SQI according to [1] Annex D.

AWGN refers to Additive White Gaussian Noise.

As a pre-requisite to perform this test, IRD shall correctly pass the following tasks:

- Task 3:51 Verification of Signal Strength Indicator (SSI)
- Task 3:52 Verification of Signal Quality Indicator (SQI)

Measurement record2 shows the minimum tests that shall be performed. Signal levels and signal quality (i.e added AWGN) can be adjusted from the initial values shown to ensure the required ΔS and ΔQ conditions are met.

Test procedure:

1. Configure the transport stream and setup the instruments. Use the DVB-T2 mode 32k extended bandwidth, 256QAM rotated, GI1/16, PP4, R2/3, L1-ACE & TR PAPR.
2. Set the signal level of the both carriers CH A and CH B to the same level. The signal level shall correspond good reception quality (no errors in decoded video).
3. Perform automatic channel search. The logic of the automatic search function shall be as follows:
 - If any services are detected during the automatic search the current service list shall be replaced by the new service list.
 - If no services are detected during the automatic search the current service list shall be kept or deleted.
4. Check that the channel list has services configured in the transport stream.
5. Check that the services on the channel list is listed once and not duplicated. Check which channel is received by trying to attenuate the signal level. The services from received channel are frozen when the signal level is too low. Restore the attenuations to a level before it was changed.
6. Fill in OK or NOK in the measurement record depending if the services were deleted.
7. Fill in OK or NOK in the measurement record 2 depending if the services were installed from expected channel.

Repeat the test for the rest of the test points in the measurement record 2.

Expected result:

All the test results are OK.

Test result(s)

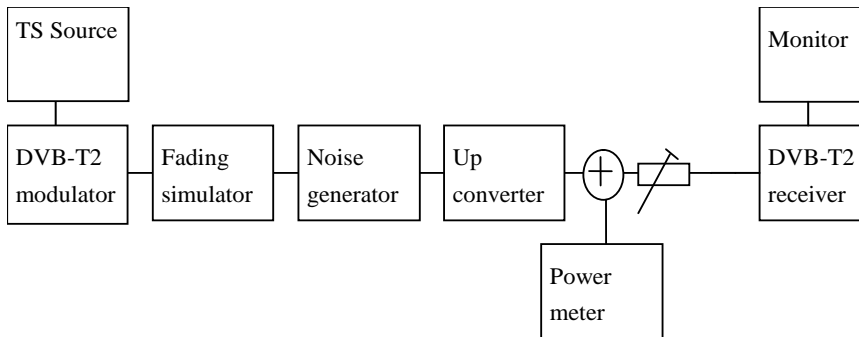

Measurement record 1:

| Requirement | Result OK or NOK |
|---|---------------------|
| The logic of the automatic search function shall be as follows: If any services are detected during the automatic search the current service list shall be replaced by the new service list. If no services are detected during the automatic search the current service list shall be kept or deleted. | |
| After automatic channel search the channel lists do not contain duplicated services. | |

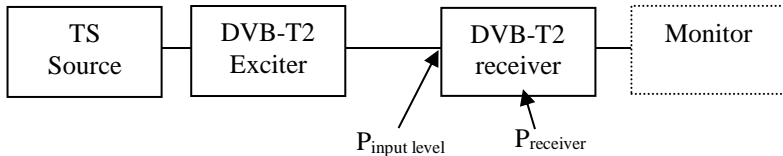

| | | | |

|--|---|
| Test Case | Task 3:50 DVB-T2: Verification of Signal Strength Indicator (SSI) |
| Section | NorDig Unified 3.4.4.6 |
| Requirement | <p>The NorDig IRD shall be provided with a signal strength indicator (SSI). The value for the SSI shall be referred to the IRD RF signal input.</p> <p>The NorDig IRD shall be able to determine signal strength within a range starting from 15 dB lower than the reference signal level defined in Table 3.7 (1) and up to 35dB above that value or maximum signal input level defined in section 3.4.10.5 (1)</p> <p>The absolute accuracy shall be ± 5 dB at RF signal input levels -80 dBm to -60 dBm and ± 7 dB for RF signal input levels higher than -60 dBm.</p> <p>The relative accuracy should be ± 3 dB between center frequencies within one frequency band, e.g. VHF Band III or UHF Band IV/V, supported by the receiver.</p> <p>Signal strength indicator shall have a relative value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The signal strength indicator shall be updated regularly once per second.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the correct functionality of the signal strength indicator.</p> <p>Equipment:</p>  <p>Gaussian channel profile used i.e. no need for fading simulator.</p> <p>In this test, the signal input level $P_{\text{input level}}$ at the RF input must be known.</p> <p>The test procedure assumes that the P_{receiver} is not displayed by the receiver. If the P_{receiver} is displayed by the receiver this test procedure can be simplified.</p> <p>Test procedure:</p> <p>Verify the SSI value:</p> <ol style="list-style-type: none"> 1. Set-up the test system 2. Determine the attenuation of the test system so that the signal input level at the receiver input is known in the measured frequencies. 3. Use the following DVB-T2 mode {32K extended, 256QAM, PP4, $R=2/3, \Delta/T_U=1/16$} and signal bandwidth of 8MHz. 4. Set the up-converter to frequency 474MHz (K21). 5. Set the signal level into the receiver according to measurement record 1. |

6. Do the channel search.
7. Fill in the SSI value displayed by the receiver in the measurement record 1.
8. SSI_{min} and SSI_{max} defines the allowed range of the displayed value.
9. Fill in the measurement record 1 OK or NOK depending of the displayed SSI value.
10. Measure rest of the frequencies and DVB-T2 modes.
11. Fill in the measurement record 1.

Verify the relative error:

1. Convert the displayed SSI values to $P_{receiver}$ [dBm]. Select the correct formula for calculating $P_{receiver}$ according to the displayed SSI value as shown below:

$$P_{receiver} = (3/2) * (SSI - 90) + 20 + P_{reference} \quad \text{if } 90 \leq SSI < 100$$

$$P_{receiver} = (1/4) * (SSI - 10) + P_{reference} \quad \text{if } 10 \leq SSI < 90$$

$$P_{receiver} = (3/2) * SSI - 15 + P_{reference} \quad \text{if } 0 \leq SSI < 10$$

2. Fill in the dBm values in the measurement record 2 for corresponding signal input level.
3. Calculate the average value of the $P_{receiver}$ values in three frequencies within a frequency band.
4. Verify the calculated $P_{receiver}$ [dBm] values are within ± 3 dB from the average value.
5. Fill in the measurement record 2 OK or NOK.

Expected result:

All the measurements shall be OK.

Displayed SSI shall be displayed in [%] and updated once per second.

| Test Case | Task 3:51 DVB-T2: Verification of Signal Quality Indicator (SQI) |
| Section | NorDig Unified 3.4.4.7.2 |
| Requirement | <p>The NorDig IRD for DVB-T2 shall be provided with a signal quality indicator (SQI). The value for the SQI shall be referred to a PLP in the received signal at the NorDig IRD RF signal input.</p> <p>The signal quality indicator shall have a relative value within a range from 0% to 100% and with a resolution of 1%.</p> <p>The integration time for the signal quality shall be over a period of 5 seconds.</p> <p>The signal quality indicator shall be updated regularly at least once per second.</p> <p>The signal quality indicator (SQI) in [%] shall be calculated for the received PLP according to the formulas defined in [1].</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the correct functionality of the signal quality indicator.</p> |

Equipment:

Gaussian channel profile used i.e. no need for fading simulator.

C/N_{input} refers to generated DVB-T2 signal C/N at receiver input.

$C/N_{receiver}$ refers to C/N determined by the receiver under test.

$$C/N_{rel} = C/N_{input} - C/N_{NorDigP1}$$

$C/N_{NorDigP1}$ refers to table 3.11 at [1].

First we need to define the required C/N_{input} for the QMP2. After that we know what is the expected rescale of BER_SQI_{min} and BER_SQI_{max} .

Test procedure:

1. Set up the test instruments
2. Use the following DVB-T2 mode {32KE, 256QAMR, PP4, R3/5, G19/256} and signal bandwidth 8MHz.
3. Set the up-converter to frequency 666MHz (K45).
4. Do the channel search.
5. Determine the lowest required C/N by adjusting the C/N_{input} until the quality measurement procedure 2 error free video is fulfilled.
6. Fill in the measurement record 1 the C/N_{input} value defined as $C/N_{receiver}$. Later in this test procedure the value $C/N_{receiver}$ is used for rescaling of the BER_SQI_{min} and BER_SQI_{max} values.
7. Decrease the C/N_{input} in 1dB step starting from highest value in measurement record 2.
8. Fill in the displayed SQI in the measurement record 2.
9. Repeat the test for the DVB-T2 mode {32KE, 256QAMR, PP4, R2/3, G1/16} and signal bandwidth 8MHz.
10. Repeat the test for the DVB-T2 mode {32KE, 256QAMR, PP2, R3/4, G1/8} and signal bandwidth 8MHz.
11. Do the calculations in the rest of the test procedure.

SQI_{min} calculations:

12. Calculate SQI_{min} for all C/N_{input} values using formulas

$$SQI_{min} = 0, \quad \text{if } C/N_{rel} - 1 < -3 \text{ dB}$$

$$SQI_{min} = (C/N_{rel} - 1 + 3) * BER_SQI_{min}, \quad \text{if } -3 \text{ dB} \leq C/N_{rel} - 1 \leq 3 \text{ dB}$$

$$SQI_{min} = 100, \quad \text{if } C/N_{rel} - 1 > 3 \text{ dB}.$$

SQI_{max} calculations:

13. Calculate SQI_{max} for all C/N_{input} values using formulas

$$SQI_{max} = 0, \quad \text{if } C/N_{rel} + 1 < -3 \text{ dB}$$

$$SQI_{\max} = (C/N_{\text{rel}} + 1 + 3) * BER_SQI_{\max}, \text{ if } -3 \text{ dB} \leq C/N_{\text{rel}} + 1 \leq 3 \text{ dB}$$

$$SQI_{\max} = 100, \text{ if } C/N_{\text{rel}} + 1 > 3 \text{ dB}.$$

Where BER_SQI_{\min} is:

$$BER_SQI_{\min} = 0, \text{ if } C/N_{\text{rel}} - 1 - (C/N_{\text{receiver}} - X) < -2.4 \text{ dB}$$

$$BER_SQI_{\min} = 100/15, \text{ if } -2.4 \text{ dB} \leq C/N_{\text{rel}} - 1 - (C/N_{\text{receiver}} - X) \leq -2 \text{ dB}$$

$$BER_SQI_{\min} = 100/6, \text{ if } C/N_{\text{rel}} - 1 - (C/N_{\text{receiver}} - X) > -2 \text{ dB}.$$

Where BER_SQI_{\max} is:

$$BER_SQI_{\max} = 0, \text{ if } C/N_{\text{rel}} + 1 - (C/N_{\text{receiver}} - X) < -2.4 \text{ dB}$$

$$BER_SQI_{\max} = 100/15, \text{ if } -2.4 \text{ dB} \leq C/N_{\text{rel}} + 1 - (C/N_{\text{receiver}} - X) \leq -2 \text{ dB}$$

$$BER_SQI_{\max} = 100/6, \text{ if } C/N_{\text{rel}} + 1 - (C/N_{\text{receiver}} - X) > -2 \text{ dB}.$$

And where X is:

X = 17.6 for 32KE, 256QAMR, PP4, R3/5, G19/256, 8MHz

X = 19.0 for 32KE, 256QAMR, PP4, R2/3, G1/16, 8MHz

X = 20.8 for 32KE, 256QAMR, PP2, R3/4, G1/8, 8MHz

Expected result:

All the test result are OK.

The signal quality indicator is updated regularly once per second.

| Test Case | Task 3:52 DVB-T2: Changes In Modulation Parameters |
| Section | NorDig Unified 3.4.5 |
| Requirement | <p>The terrestrial NorDig IRD-T2 shall automatically recover from changes in the following P1, L1 pre-signalling data and L1 post-signalling parameters at the end of a superframe without a break in the received DVB-T2 signal. An error-free TS shall be available within five seconds for any P1 and/or L1 pre-signalling change. An error-free TS shall be output within five seconds for any L1 post-signalling FEF change and within two seconds for any other L1 post-signalling change.</p> <p>The terrestrial NorDig IRD-T2 shall automatically recover from changes in the following P1, L1 pre-signalling and L1 post-signalling parameters occurring at any time followed by a break in the received signal. An error-free TS shall be output within five seconds.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify that receiver can automatically recover from changes in the specified P1, L1 pre-signaling and L1 post-signaling parameter occurring at any time followed by a break in the received signal and output an error free TS.</p> <p>Equipment:</p>  <pre> graph LR TS[TS Source] --> Mod[DVB-T2 modulator] Mod --> Fading[Fading simulator] Fading --> Noise[Noise generator] Noise --> Up[Up converter] Up --> Sum((+)) PM[Power meter] --> Sum Sum --> Switch[Switch] Switch --> Rec[DVB-T2 receiver] Rec --> Mon[Monitor] </pre> <p>This test includes the use of L1 post-signalling configurable signaling fields. Those fields signalize transmission parameters per PLP.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.</p> <p>This test checks receiver capability to adapt to parameter changes in broadcasted DVB-T2 signal with break in the received RF signal. The receiver shall adapt to the received signal without any user action.</p> <p>Different DVB-T2 modulators from different vendors may have different time to broadcast valid a signal after the change of the parameter in the broadcasted signal. This time from parameter change to valid signal is excluded from the required receiver synchronization time. Therefore, the test operator needs to know this time and take it to account when calculating the receiver synchronization time.</p> <p>Synchronisation time is not tested for rotated constellation changes, but receiver operability is tested on test Task 3:36.</p> <p>Synchronisation time is not tested for time interleaving length changes, but receiver operability is tested on test Task 3:53.</p> |

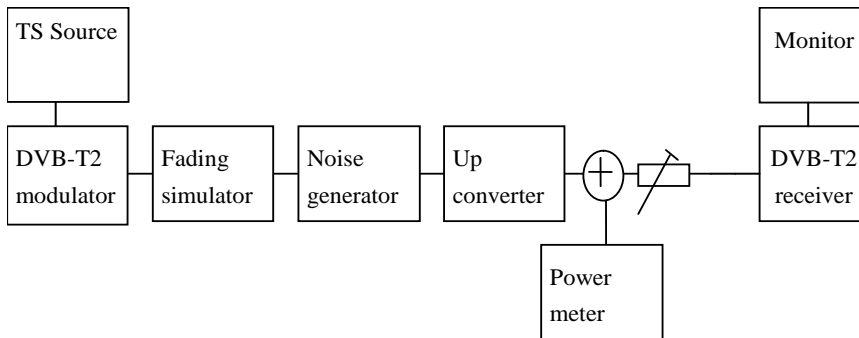

| | |
|-----------------------|---|
| | <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Setup the instruments 2. Use frequency 666MHz (K45) 3. Use the following DVB-T2 mode 32k extended, 256QAM rotated, G1/16, R2/3 and signal bandwidth 8MHz. 4. Open the switch to break the received RF signal 5. Change the following transmission parameters in turn by changing the P1, L1 pre-signaling and L1 post signalling respectively FFT size: 32K,16K,8K,4K,2K and 1K Bandwidth extension: yes, no PAPR: no, ACE, TR Guard interval: G1/32, G1/16, G1/8, G1/4, G1/128, G19/128,G19/256 Pilot Pattern: PP2, PP4,PP6,PP7 Number of data symbols: 60, 62 Code Rate: R3/5, R2/3, R3/4 Modulation: 256 QAM T2 system id change from 0 to 65535 (decimal) Cell id change from 0 to 65535 (decimal) Network id change (optional) from 0 to 65535 (decimal) T2 version change from 1.2.1 to 1.3.1 PLP_id change from 1 to 2 for TS carrying installed service(s) on the receiver Change of FEF being disabled to enabled Changing length of the FEF, when enabled, from 0 ms to 56.875 ms (other parameters needed to be changed are specified on test Task 3:44) 6. Wait for the DVB-T2 modulator output to become valid and stable (this time is modulator specific – a minimum of 15 seconds is recommended for some modulators) 7. Close the switch to enable the RF signal to the receiver and record the time taken to achieve QMP1. 8. Verify receiver automatically adapts to new parameter settings without any user action. <p>Expected result:</p> <p>The receiver can automatically recover from changes in the specified P1, L1 pre-signaling and L1 post-signaling parameter occurring at any time followed by a break in the received signal and output an error free TS within 5 seconds (excluding modulator stabilization time) without requiring a channel scan.</p> <p>The time limits in this clause exclude the time for the DVB-T2 modulator to output a stable and valid signal.</p> |

| Test Case | Task 3:59 DVB-T2: Performance: Minimum IRD Signal Input Levels on 0dB echo channel |
| Section | NorDig Unified 3.4.10.4 |
| Requirement | <p>The NorDig IRD shall provide QEF reception for the minimum signal levels (P_{\min}) for the supported frequency range as stated below (at 290K).</p> <p>For 7 MHz Normal Bandwidth DVB-T/T2 signal: $P_{\min} = -105.7 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$, and</p> <p>For 8 MHz Normal Bandwidth DVB-T/T2 signal: $P_{\min} = -105.2 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$, and</p> <p>For 1.7 MHz Normal Bandwidth DVB-T2 signal: $P_{\min} = -112.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$, and</p> <p>For 7 MHz Extended Bandwidth DVB-T2 signal: $P_{\min} = -105.7 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$, and</p> <p>For 8 MHz Extended Bandwidth DVB-T2 signal: $P_{\min} = -105.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$, and</p> <p>For 1.7 MHz Extended Bandwidth DVB-T2 signal: $P_{\min} = -112.1 \text{ dBm} + \text{NF [dB]} + \text{C/N [dB]}$,</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the sensitivity of the receiver on frequency selective channel.</p> <p>Equipment:</p>  <p>The 0 degree channel center shall be used in fading simulator (see 2.3.4) 0dB echo.</p> <p>Be careful in impedance matching of cables, adapters and etc.</p> <p>The 0dB echo profile must be activated when measuring the power level of the signal.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.</p> <p>Test procedure for the sensitivity on the frequency selective channel:</p> <p>Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.</p> <ol style="list-style-type: none"> 1. Set up the test instruments |

2. Use the following DVB-T2 mode {32K extended, 256QAM, PP7, R2/3, GI1/128} and signal bandwidth 8MHz.
3. Set the up-converter to frequency 666.0 MHz (K45).
4. Set the fading simulator to 0dB echo profile. (Delay 1.95us, 0 degree phase at channel center and attenuation 0dB for the second path.)
5. Determine the attenuation of the attenuator and the cables.
6. Measure the input level to the attenuator.
7. Calculate the receiver input signal level.
8. Increase the received input level from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
9. Fill in the measured value in the measurement record.
10. Verify that the channel search finds the services on measured minimum input signal level.
11. Repeat the test for the rest of the DVB-T2 modes with signal bandwidth of 8MHz and 7MHz on the measurement record. DVB-T2 modes with 7MHz signal bandwidth are tested on center frequency 198.5MHz (K8).
12. Optionally, repeat the test for the rest of the DVB-T2 modes with signal bandwidth of 1.7MHz on the measurement record. DVB-T2 mode with 1.7MHz signal bandwidth is tested on center frequency 206.352 MHz (9C).

Expected result:

Required minimum signal level shall be equal or lower in dBm than specified in [Table 2.87](#), [Table 2.98](#), [Table 2.109](#) and [Table 2.114](#) on measured frequencies, DVB-T2 modes and signal bandwidths for all echo delays.

If signal bandwidth 1.7MHz is supported, the required minimum signal level shall be equal or lower in dBm than specified in [table 2.86](#) on measured frequency and for DVB-T2 mode.

|---|--|
| Test Case | Task 3:62 DVB-T2: Performance: Immunity to “digital” signals in Other Channels |
| Section | NorDig Unified 3.4.10.7.16 |
| Requirement | <p>The NorDig IRD shall, for the supported frequency ranges, permit an interfering DVB-T or DVB-T2 signal with a minimum interference to signal level ratio (I/C) as stated in the NorDig Specification (1) while maintaining QEF reception.</p> <p>The requirements in this paragraph refer, for DVB-T, to the modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$} and {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$} and {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$} and for DVB-T2 to the modes given in NorDig Specification.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the QEF reception for digital signal interference on adjacent or other channels.</p> <p>Equipment:</p>  |

Verify that the digital signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.

Worst case is when wanted and interference signals are DVB-T2 modulated in extended carrier mode in adjacent channels. This test can be performed using DVB-T modulated interferer, because the performance difference is expected to be negligible. When using DVB-T modulated interferer, signal bandwidth of the DVB-T modulated signal must be selected according to frequency range, except for the signal bandwidth 1.7MHz, which is not supported in the DVB-T system.

Many of the European countries are going to free channel 61 and upwards to other types of services than TV. In this test a DVB-T interferer is used on channels over 60 in order to measure the interference from DVB-T system for comparison reasons.

Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

Test procedure:

1. Set up the test instruments
2. Use the following DVB-T2 mode {32K extended, 256-QAM rotated, PP4, $R=3/4$, $\Delta/T_U=1/16$ } and signal bandwidth 8MHz.
3. Set the channel A up-converter to 666.0MHz (K45).
4. Set the channel B up-converter to 674.0MHz (K46).
5. Set the receiver input level for the DVB-T2 signal in channel B to -20 dBm.
6. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.
7. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
8. Repeat the test when the channel B up-converter is set to frequencies 658.0 MHz (K44), 650.0 MHz (K43), 682.0 MHz (K47).
9. Repeat the test according to procedure above for the image channel¹⁾. Set the receiver input level for the DVB-T2 signal in channel B to -20dBm.
10. Set the channel A up-converter to 786.0MHz (K60).
11. Set the channel B up-converter to 794.0MHz (K61).
12. Set the receiver input level for the DVB-T2 signal in channel B to -20 dBm.
13. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is still fulfilled.
14. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.
15. Repeat the test when the channel B up-converter is set to frequencies 770.0 MHz (K58), 778.0 MHz (K59), 802.0 MHz (K62).
16. Repeat the test according to procedure above for the image channel¹⁾. Set the receiver input level for the DVB-T2 signal in channel B to -20dBm.
17. Change the signal bandwidth to 7MHz.
18. Use the following DVB-T2 mode {32K normal, 256-QAM rotated, $R=3/4$, PP2, $\Delta/T_U=1/8$ } and signal bandwidth 7MHz.
19. Set the channel A up-converter to frequency 198.5 MHz (K8).
20. Set the channel B up-converter to frequency 205.5 MHz (K9).
21. Set the receiver input level of the DVB-T2 signal in channel B to -20dBm.
22. Decrease the DVB-T2 signal level in channel A to a signal level when the quality measurement procedure 2 (QMP2) is fulfilled.
23. Fill in the measured signal level difference between channel A and channel B signals in dB in measurement record.

24. Repeat the test when the channel B up-converter is set to frequencies 191.5 MHz (K7), 184.5 MHz (K6) and 212.5 MHz (K10). If receiver supports optional frequency ranges and signal bandwidths, repeat the test for the optional frequencies and signal bandwidths.
For 1.7MHz DVB-T2 signal use DVB-T2 mode {8K normal, 64QAM, R=2/3, PP2, $\Delta/T_U=1/8$ } corresponding signal bandwidth 1.535 MHz.

¹⁾ Example: if intermediate frequency IF is 36.15MHz, the image channel is calculated for channel 45 as $666\text{MHz} + 2 * 36.15\text{MHz} = 738.3\text{MHz}$ which is close to channel 54.

Expected result:

The wanted DVB-T2 signal shall be QEF for the interference signal levels specified for DVB-T2 modes, signal bandwidths and supported frequencies.

Test result(s)

| Test Case | Task 3:63 DVB-T2: Performance: Immunity to “LTE 700 MHz” signals in Other Channels |
| Section | NorDig Unified 3.4.10.7.32 |
| Requirement | <p>The terrestrial NorDig IRD and IRD-T2 shall, for the supported frequency ranges, permit an interfering 4G (LTE) “700MHz” signal with a minimum interference to signal level ratio (I/C) as stated in the Table 3.178 [4] while maintaining QEF reception.</p> <p>The power of the interfering LTE signal, both BS and UE, varies with a traffic load and traffic type. The signal power of the LTE signal is defined as the power during the active part of the time varying LTE signal, referred to as the licensed power level (I).</p> <p>The I/C values shall (1) be fulfilled for LTE signals with traffic loads from 0% to 100 % (BS) and for traffic loads from low bit rate to high bit rate (UE). Low traffic loads can be the most demanding ones. The minimum I/C requirement shall be fulfilled for interfering licensed power level signal levels in the range of -25 dBm in case of UE signals and -15dBm in case of BS signals defined as licensed power of interfering signal, at the input of the IRD.</p> <p>The requirements in this paragraph refer,</p> <p>for DVB-T, to following modes {FFT size, modulation, code rate, guard interval, bandwidth};</p> <p>{8K, 64-QAM, R=2/3, $\Delta/T_u = 1/8$, 8MHz} and</p> <p>{8K, 64-QAM, R=2/3, $\Delta/T_u = 1/4$, 8MHz} and</p> <p>{8K, 64-QAM, R=3/4, $\Delta/T_u = 1/4$, 8MHz} and</p> <p>and for DVB-T2 to the modes {FFT size, modulation, pilot pattern, code rate, guard interval, bandwidth}</p> <p>{32KE, 256-QAM R, PP4, R=2/3, $\Delta/T_u = 1/16$, 8MHz}</p> <p>{32KE, 256-QAM R, PP4, R=3/5, $\Delta/T_u = 19/256$, 8MHz}</p> <p>{32KN, 256-QAM R, PP4, R=2/3, $\Delta/T_u = 19/256$, 7MHz}</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the QEF reception for LTE 700 MHz signal interference on adjacent or other channels.</p> <p>Equipment:</p> |

Verify that the interfering LTE signal on the adjacent or the other channels don't have too high shoulders, which could cause out-of-band emissions in the reception of the wanted digital TV signal.

From IRD point of view most demanding LTE signal might be that with low traffic load.

The LTE transmission is generated by using following LTE signal characteristics:

BS 0% traffic load (LTE_BS-idle_V3_synth.wv)

UE Video stream traffic (short_UE-Video-Stream_V2.wv)

Files in I/Q file format specified above are available on the ETSI website

http://www.etsi.org/deliver/etsi_en/303300_303399/303340/01.01.02_60/en_303340v010102p0.zip

or if not available, they can be found on the NorDig homepage.

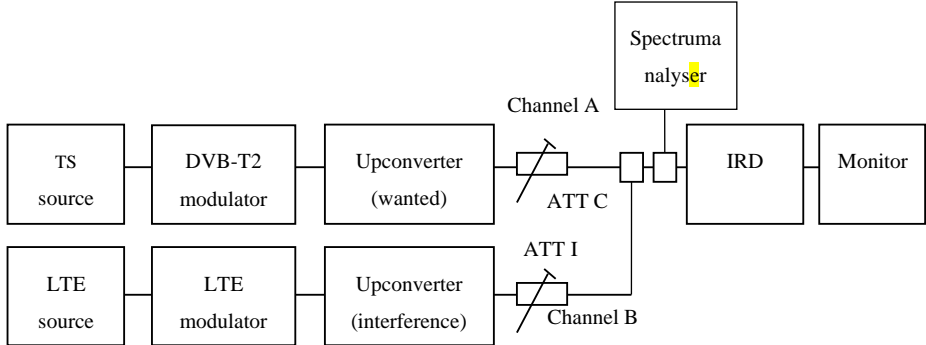

Use Mode A (Single PLP) and L_f parameter settings defined in Table 2.17.

Test procedure:

1. Set up the test instruments
2. Use the following DVB-T2 mode {32KE, 256-QAM R, PP4, R=2/3, G =1/16, 8MHz}
3. Set the channel A up-converter to 690.0MHz (K48).
4. Set the channel B up-converter to 708.0MHz .
5. Set the LTE interferefer to UE Video traffic mode.
6. Set the receiver input level for the LTE signal in channel B to -25 dBm licensed power. (Note the rms power measured on a power meter with sufficient averaging to remove the large power fluctuations in the signal will be -42.7 dBm.)
7. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.
8. Fill in the measured signal level difference between channel A and channel B (licensed power) signals in dB in measurement record.
9. Repeat the test when the channel B up-converter is set to frequencies 718.0 MHz, 728.0 MHz.
10. Set the channel B up-converter to 763.0MHz.
11. Set the LTE interferefer to BS 0% traffic load mode.
12. Set the receiver input level for the LTE signal in channel B to -15 dBm licensed power. (Note the rms power measured on a power meter with sufficient averaging to remove the power fluctuations in the signal will be -23.3 dBm.)
13. Decrease the wanted signal level in channel A to a signal level when the quality measurement procedure 2 is still fulfilled.

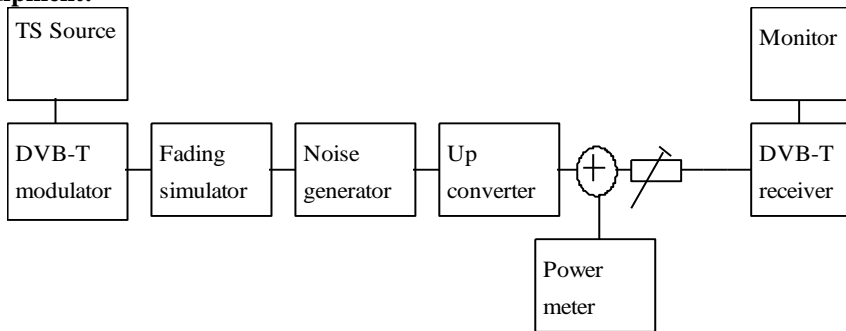

| | <p>14. Fill in the measured signal level difference between channel A and channel B (licensed power) signals in dB in measurement record.</p> <p>15. Repeat the test when the channel B up-converter is set to frequencies 773.0 MHz, 783.0 MHz.</p> <p>16. Repeat the test for the DVB-T2 mode {32KE, 256-QAM R, PP4, R=3/5, G=19/256, 8MHz}.</p> <p>Expected result:</p> <p>The wanted DVB-T2 signal shall be QEF for the interference signal levels as specified.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 3:65 DVB-T2: Performance: Performance in Time-Varying Channels |
| Section | NorDig Unified 3.4.10.98 |
| Requirement | <p>The NorDig IRD shall be able to operate with all signal time variations that naturally exist in connection with fixed roof-top reception (e.g. mast sway, antenna sway) and in-house portable reception (e.g. people walking around the receiving antenna). None of the above mentioned performance parameters should be significantly negatively affected when such channel time variations exist.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 20 Hz and a delay of 20 μs, corresponding to a Doppler shift of +/- 10 Hz (after AFC), compared to a 0 dB echo with frequency separation equal to 1 Hz and a delay of 20 μs, corresponding to a Doppler shift of +/- 0.5 Hz (after AFC). The requirements in this paragraph refer for DVB-T to the modes {8K, 64-QAM, R=2/3, $\Delta/T_u=1/8$} and {8K, 64-QAM, R=2/3, $\Delta/T_u=1/4$}.</p> <p>The increase in required C/N for QEF reception shall be less than 3 dB for a 0 dB echo with frequency separation equal to 10 Hz and a delay of 20 μs, corresponding to a</p> |

| | |
|--|--|
| | <p>Doppler shift of ± 5 Hz (after AFC), compared to a 0 dB echo with frequency separation equal to 1 Hz and a delay of 20 μs, corresponding to a Doppler shift of ± 0.5 Hz (after AFC). The requirement in this paragraph refer for DVB-T to the mode {8K, 64-QAM, $R=3/4$, $\Delta/T_u=1/4$} and for DVB-T2 to the modes given in the measurement record below (4). For 1.7 MHz these DVB-T2 modes apply as well, except that the FFT size is 8K</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the reception on a channel where time variations exists.</p> <p>1.7MHz BW DVB-T2 modes are optional to test.</p> <p>Equipment:</p>  <pre> graph LR TS[TS Source] --> DVB_T_mod[DVB-T modulator] DVB_T_mod --> Fading[Fading simulator] Fading --> Noise[Noise generator] Noise --> Up[Up converter] Up --> Sum((+)) Sum --> DVB_T_rec[DVB-T receiver] DVB_T_rec --> Monitor[Monitor] Sum --> Power[Power meter] </pre> <p>The 0 degree channel center shall be used in fading simulator (see 2.3.5). This is valid for 0Hz doppler shift.</p> <p>Use Mode A (Single PLP) parameter settings defined in 2.3.7Summary of DVB-T2 modes in DVB-T2 test tasks.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Set up the test instruments. 2. Use the following DVB-T2 mode: {32K extended, 256-QAM rotated, $R=3/4$, $\Delta/T_u=1/128$}. 3. Use channel K45 (666MHz). 4. Configure path 1 to type of static, attenuation 0dB, delay 0μs. 5. Configure path 2 to type of pure Doppler, attenuation 0dB, delay 20μs and frequency separation to 0Hz. 6. Set the receiver input level to -50 dBm. 7. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled. 8. Fill in the measured value in dB in the measurement record. 9. Repeat the test for the rest of the frequency separation values in the measurement record. Be careful of value which is configured in fading simulator. It can be speed, Doppler or frequency separation. 10. Fill the C/N result in the measurement record. 11. Repeat the test for the rest of the DVB-T2 modes in measurement record. <p>Expected result:</p> |

| | | | | |
|-----------------------|---|---------------------|---------------------------|----------|
| | For the DVB-T2 modes the increase in the required C/N shall be less than 3dB for 0dB 20µs echo from frequency separation 1Hz to 10Hz. | | | |

| Test Case | Task 3:66 DVB-T2: Performance: Synchronisation for varying echo power levels in SFN |
| Section | NorDig Unified 3.4.10.940 |
| Requirement | For the DVB-T modes {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/8$ }, {8K, 64-QAM, $R=2/3$, $\Delta/T_U=1/4$ } and {8K, 64-QAM, $R=3/4$, $\Delta/T_U=1/4$ }, the required C/N value, specified in table 3.18 of the NorDig specification, for QEF reception shall be obtained when the channel contains two paths with relative delay from 1.95 μ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing. For the DVB-T2 modes given in Table 3.94, the required C/N value, specified in table 3.19 of the NorDig Specification, for QEF reception shall be obtained when the channel contains two paths with relative delay from 1.95 μ s up to 0.95 times guard interval length and the relative power levels of the two paths are dynamically varying including 0dB echo level crossing. The C/N value is defined at 0 dB level crossing. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the SFN synchronisation when the amplitude of the echo compared to the amplitude of the direct signal varies in a function of time.</p> <p>1.7 MHz DVB-T2 modes not tested.</p> <p>Equipment:</p>  <pre> graph LR TS_Src[TS Source] --> DVB_T2_Mod[DVB-T2 modulator] DVB_T2_Mod --> Fading_Sim[Fading simulator] Fading_Sim --> Noise_Gen[Noise generator] Noise_Gen --> Up_Conv[Up converter] Up_Conv --> Sum((+)) PM[Power meter] --> Sum Sum --> Switch[Switch] Switch --> DVB_T2_Rec[DVB-T2 receiver] DVB_T2_Rec --> Monitor[Monitor] </pre> |

The 0 degree channel center shall be used in fading simulator (see 2.3.5).

Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

Test procedure for variations of the echo attenuation in a function of time:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following mode 32K extended, 256QAM, PP7 R=2/3, $\Delta/T_U=1/128$, 8 MHz.
3. Use channel K45 (666MHz).
4. Open the switch.
5. Configure the first path signal (direct) with following parameters: 0dB attenuation and 0 μ s delay.
6. Configure the second path signal (1st echo) with following parameters: 0dB attenuation and first delay value from the measurement record.
7. Set the receiver input level to -50 dBm.
8. Configure the third path signal (2nd echo) with following parameters: 1dB attenuation and delay same as for the second path and 0.1Hz frequency separation.
9. Close the switch.
10. Increase the C/N from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
11. Fill in the measured required C/N value in dB in the measurement record.
12. Repeat the test for the rest of the echo delay values in the measurement record following the procedure above. Between change of the echo delay, RF input signal to the receiver shall be disconnect.
13. Repeat the test for the rest of the DVB-T2 modes in measurement record. Use channel K8 (198.5MHz) for the DVB-T2 modes with signal bandwidth 7MHz.

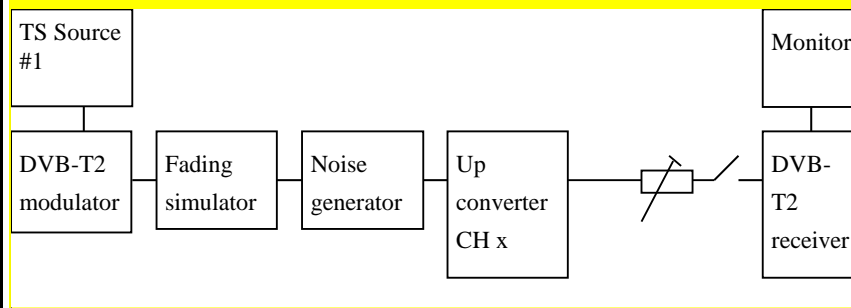

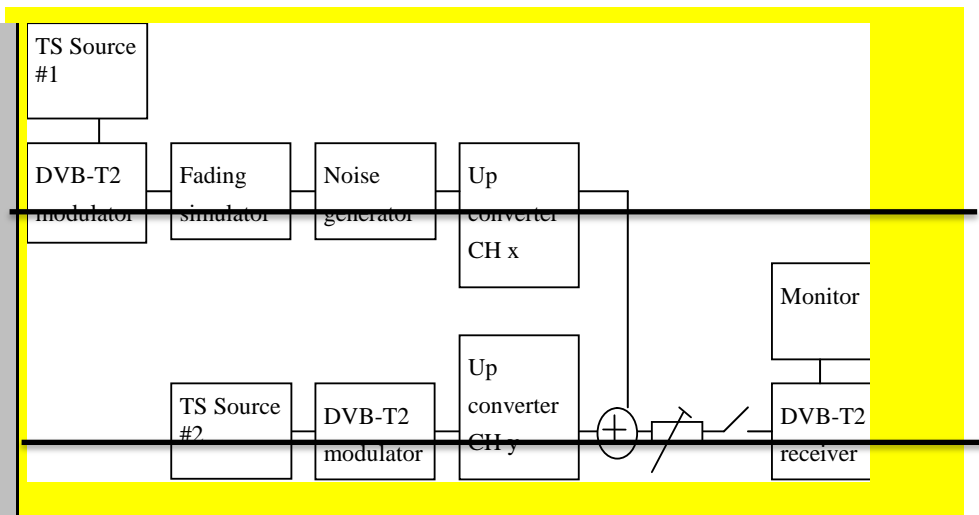

Expected result:

The IRD shall maintain the SFN synchronisation when the amplitude of the echo signal varies in a function of time. The required C/N shall not exceed the specified value in table 3.19.

[illegible]

| Test Case | Task 3:67 DVB-T2: Performance: C/(N+I) Performance in SFN for more than one echo |
| Section | NorDig Unified 3.4.10.104 |
| Requirement | <p>For the DVB-T2 modes shown in (1), the required C/N value for profile 2 (specified in (1)) for QEF reception shall be obtained when the channel contains two static paths with relative delay from 1.95µs up to 0.95 times guard interval length, independently of the relative amplitudes and phases of the two paths. For 1.7 MHz these DVB-T2 modes apply as well, except that the FFT size is 8K.</p> <p>If there exists one or more FFT window positions for the time synchronisation that will give an aggregate available C/(N+I) larger than or equal to the required EPT (Effective Protection Target), the NorDig IRD shall be able to find one of these positions, independently of echo profile.</p> <p>The NorDig IRD shall also be able to correctly equalise the signal for echoes up to 57/64 (≈89.1%) of the Nyquist time (TU/Dx) for the scattered pilots (after time interpolation) for a particular FFT size, pilot pattern and RF bandwidth. (Interval of correct equalisation), independently of the echo profile.</p> <p>For a specific echo attenuation the required C/N shall have approximately the same value, independent of the actual delay length. The deviation in required C/N from the median value shall be less than 1 dB, for any echo length from 1.95 µs up to 0.95 times guard interval length.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To verify the SFN synchronization of the receiver when two echo signals are present.</p> <p>1.7 MHz DVB-T2 modes not tested.</p> <p>Equipment:</p> |

The 0 degree at channel center shall be used in fading simulator (see 2.3.5).

Use Mode A (Single PLP) parameter settings defined in 2.3.7 Summary of DVB-T2 modes in DVB-T2 test tasks.

1.7MHz signal BW DVB-T2 modes are tested on 206.352MHz (9C)
7MHz signal BW DVB-T2 modes are tested on 198.5MHz (K8)
8MHz signal BW DVB-T2 modes are tested on 666MHz (K45),

Test procedure:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following DVB-T2 mode 32K extended, 256QAM, PP4, $R=2/3$, $\Delta/T_U=1/16$ and signal bandwidth 8MHz and center frequency 666MHz (K45).
3. Open the switch.
4. Configure one path of the channel simulator to have a 0dB attenuation, 0 μ s delay and 0 degree phase.

5. Configure the second path of the channel simulator to have relative delay difference $-100.1\mu\text{s}$ and attenuation 21dB (pre echo) and 0 degree phase.
6. Configure the third path of the channel simulator to have relative delay difference $+100.0\mu\text{s}$ and attenuation 15 dB (post echo) and 0 degree phase.
7. Set the receiver input level to -50 dBm.
8. Close the switch.
9. Increase the required C/N value from low value to higher value until the quality measurement procedure 2 (QMP2) is fulfilled.
10. Fill in the required C/N value in dB in the measurement record.
11. Measure the rest of the required C/N values starting at the bottom of the table and upward.
12. Fill in the results in the measurement record. During the change of the delay and the attenuation, the input RF signal to receiver shall be disconnected.
13. Repeat the test for the rest of the DVB-T2 modes.

Expected result:

The IRD shall synchronize in all combinations defined in measurement record and the required C/N value shall not exceed the required C/N defined for profile 2: 0dB echo in table 2.4 (PP2) and table 2.5 (PP4).

Test result(s)

| Test Case | Task 3:68 DVB-T2: Performance: C/(N+I) Performance in SFN inside the guard interval |
| Section | NorDig Unified 3.4.10.1 10 |
| Requirement | For the DVB-T2 modes shown in Table 3.9 (1), the required C/N value for profile 2 (specified in (1)) for QEF reception shall be obtained when the channel contains two static paths with relative delay from 1.95µs up to 0.95 times guard interval length, independently of the relative amplitudes and phases of the two paths. For 1.7 MHz these DVB-T2 modes apply as well, except that the FFT size is 8K For specific echo attenuation, the required C/N shall not be more than 1 dB higher compared to the median value when calculated for the required C/N values over the echo delays from 1.95 µs up to 0.95 times guard interval length. |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | Purpose of test: To verify the required C/N for echoes in SFN inside the guard interval. |

Equipment:

Common DVB-T2 parameters in this test task:

| | |
|------------------------|-------------------------------|
| Constellation rotation | Yes |
| PAPR | L1-ACE & TR PAPR |
| SISO/MISO | SISO |
| FEC Frame length | 64800 |
| Input mode | Mode A |
| TFS | No |
| Mode | HEM (high efficiency mode) |
| FEF | Not used |
| Auxiliary streams | Not used |

The 0 degree channel center shall be used in fading simulator (see 2.3.5).

Test procedure for required C/N in SFN for echoes inside guard interval:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following DVB-T2 mode {32K extended, 256QAM, PP4, R=2/3, $\Delta/T_U=1/16$ } and signal bandwidth 8MHz.
3. Set the up-converter to center frequency 666MHz (K45).
4. Open the switch.
5. Set the receiver input level to -50 dBm for the wanted signal.
6. Set the channel simulator relative delay difference to 1.95 us for the echo signal.
7. Set the channel simulator relative attenuation level to 0 dB for the echo signal.
8. Set C/N to such a ratio that receiver is unlocked state and reception is not possible.
9. Close the switch.
10. Increase the C/N value until the quality measurement procedure 2 (QMP2) is fulfilled.
11. Fill in the required C/N value in dB in the measurement record.
12. Measure the rest of the required C/N values for the negative and positive 0dB echoes. Fill in the results in the measurement record. During the change of the delay the input RF signal shall be disconnected.
13. Test the rest of the combinations (not marked grey) of the relative delays and attenuation levels. The delay of the echo is maintained constant when the change of the attenuation from 21dB to 1dB is done. Find the required C/N value when the reception still fulfils the quality measurement procedure 2 (QMP2). During the change of the delay and attenuation level the input RF signal shall be disconnected.
14. Continue test from step 4 by repeating the test for the rest of the DVB-T2 modes and signal bandwidth 8MHz in measurement record.
15. Set the up-converter to center frequency 198.5MHz (K8).
16. Continue test from step 4 by repeating the test for the rest of the DVB-T2 modes and signal bandwidth 7MHz in measurement record.

Expected result:

The IRD shall synchronize in all echo attenuation and delay combinations except the longest values according to below:

32K extended, 256QAM, PP4, R=2/3, $\Delta/T_U=1/16$, 8MHz: -220 μ s and 220 μ s

32K extended, 256QAM, PP4, R=3/5, $\Delta/T_U=19/256$, 8MHz: -266 μ s and 266 μ s

32K extended, 256QAM, PP2, R=3/4, $\Delta/T_U=1/8$, 8MHz: -448 μ s and 448 μ s

32K normal, 256QAM, PP4, R=2/3, $\Delta/T_U=19/256$, 7MHz: -304 μ s and +304 μ s

32K normal, 256QAM, PP2, R=3/4, $\Delta/T_U=1/8$, 7MHz: -500 μ s and +500 μ s

The required C/N value for 0dB echo shall not be higher than defined in table 2.4 (PP2) and table 2.5 (PP4).

The required C/N for a specific echo amplitude shall not be more than 1 dB higher compared to the median value when calculated for the required C/N values over the echo lengths from 1.95 μ s up to 0.95 times guard interval length.

Test result(s)

| Test Case | Task 3:69 DVB-T2: Performance: C/(N+I) Performance in SFN outside the guard interval |
| Section | NorDig Unified 3.4.10.104 |
| Requirement | <p>If there exists one or more FFT window positions for the time synchronisation that will give an aggregate available C/(N+I) larger than or equal to the required EPT (Effective Protection Target), the terrestrial NorDig IRD shall be able to find one of these positions, independently of echo profile. The terrestrial NorDig IRD shall also be able to correctly equalise the signal (referred to as Interval of correct equalization, TF) for an echo range (i.e. distance from first to last echo) up to 57/64 ($\approx 89.1\%$) of the Nyquist time (TU/Dx) for the scattered pilots (after time interpolation) for a particular FFT size, pilot pattern and RF bandwidth independently of the echo profile.</p> <p>For echoes outside the guard interval, for 8 MHz DVB-T2 signal, QEF reception shall be possible with echo levels up to the values defined in Table 3.22.</p> <p>For echoes outside the guard interval, for 7 MHz DVB-T2 signal, QEF reception shall be possible with echo levels up to the values defined in Table 3.23.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the SFN synchronisation in SFN for echoes outside guard interval.</p> <p>Equipment:</p> |

Common DVB-T2 parameters in this test task:

| | |
|------------------------|-------------------------------|
| Constellation rotation | Yes |
| PAPR | L1-ACE & TR PAPR |
| SISO/MISO | SISO |
| FEC Frame length | 64800 |
| Input mode | Mode A |
| TFS | No |
| Mode | HEM (high efficiency mode) |
| FEF | Not used |
| Auxiliary streams | Not used |

Test procedure for evaluation of synchronization for echoes outside the guard interval:

Check the different SFN synchronisation issues from 2.3.4 Receiver operability in SFN.

1. Set up the test instruments.
2. Use the following mode {32K, 256QAM, PP4, $R=3/5$, $\Delta/T_U=1/16$ } and signal bandwidth 8MHz.
3. Open the switch.
4. Set the receiver input level to -50 dBm for the wanted signal.
5. Set the channel simulator relative delay difference to 260 μ s for the echo signal.

6. Close the switch.
7. Increase the echo attenuation from low value to higher value until quality measurement procedure 2 (QMP2) is fulfilled.
8. Fill in echo attenuation result in dB in the measurement record.
9. Repeat the test the rest of the combinations of the relative delays and attenuation levels defined in measurement record.. Open the switch before changing the delay and attenuation level.
10. Repeat the test for the rest of the DVB-T2 modes in the measurement record for the signal bandwidth 8MHz.
11. Set the up-converter to center frequency 198.5MHz (K8).
12. Follow the test procedure and repeat the test for the 7 MHz signal bandwidth and DVB-T2 modes defined in the measurement record according to procedure above.

Expected result:

All the echo attenuation values shall be equal or lower compared to NorDig Unified values in tables 3.2² and 3.23.

 - MPEG2 MP@ML 576i 25Hz video PID with longterm variations of the PCR values
 - MPEG1 LII audio PID

Characteristics of the PCR variations are defined below.

Rapid variation PCR(sawtooth wave)

Long term variation PCR (constant sine wave)

Test procedure:

1. Set IRD input level to -60 dBm
2. Play out the TS
3. Do the channel search if required
4. Verify that IRD provides error free video and there is no irritating lipsync.

Expected result:

The NorDig IRD is capable of displaying an error-free picture during 5 minutes.
The audio and video shall be in synchronization, with other words, there is no irritating lipsync.

2.6 Task 6: Video

| | | | |
|----------------|---|------|--|
| Test Case | Task 6:1 Video Decoder - General | | |
| Section | NorDig Unified 5.1 | | |
| Requirement | <p>The NorDig IRD's video decoder of the NorDig IRD shall fully comply with the DVB Implementation Guidelines specification for the use of broadcasting applications regarding "25 Hz MPEG-2 SDTV IRDs and Bitstreams" "25 Hz H.264/AVC SDTV IRD and Bitstream" "25 Hz H.264/AVC HDTV video in satellite, cable IRD and terrestrial broadcasting applications, Bitstream ETSI TS 101 154.</p> <p>The video decoder of the NorDig HEVC IRD shall, in addition to above, comply with the DVB specification for broadcasting applications regarding "HEVC HDR UHD TV IRD and Bitstream" in ETSI TS 101 154.</p> <p>Observe that in a future revision of the NorDig Unified Requirements, requirements regarding "HEVC HDR HFR UHD TV IRD and Bitstream" will be added.</p> <p>The following clauses of ETSI TS 101 154 are relevant to this specification:</p> <ul style="list-style-type: none"> • 5.1 "25 Hz MPEG-2 SDTV IRDs and Bitstreams" • 5.5 "Specifications Common to all H.264/AVC IRDs and Bitstreams" • 5.6 "H.264/AVC SDTV IRDs and Bitstreams". The NorDig IRD shall support High Profile at Level 3.0 bitstreams. • 5.7.1 and 5.7.2 "Specifications common to all H.264/AVC HDTV IRDs and Bitstreams". • 5.7.2 "25 Hz H.264/AVC HDTV IRDs and Bitstream". The NorDig IRD shall support High Profile at Level 4.0 bitstreams. • 5.14.1 "Specifications Common to all HEVC IRDs and Bitstreams". • 5.14.4 "HEVC HDR UHD TV IRDs and Bitstreams" (1). Support for both PQ10 and HLG10 is required for the NorDig HEVC IRD. Only support of 50 Hz and 25 Hz frame rates are required for the NorDig HEVC IRD. (This implies support for the "HEVC HDR UHD TV Bitstream", the "HEVC UHD TV Bitstream" and the "HEVC HDTV Bitstream", excluding non-square pixel aspect ratios and excluding interlace scan). | | |
| IRD Profile(s) | Basic, HEVC, all IRDs, FE | | |
| Test procedure | This is a general requirement. It will be verified in the following tests | | |

| Test Case | Task 6:3 Video resolution scaling Up-sampling/Up-conversion |
| Section | NorDig Unified 5.4 |
| Requirement | <p>When up converting video with an encoded luminance resolution of 720x576 or 704x576 to any 1:1 pixel aspect ratio format (i.e. 1280x720 or 1920x1080), only the centred 702 of the horizontal 720 / 704 pixels shall be used. Those 702 pixels correspond to the 52 microseconds of an active line, hence preserves correct geometry in the up conversion process.</p> <p>When up converting other valid input line resolution format to any 1:1 pixel aspect (output) format (i.e. 1280x720 or 1920x1080), only the centred horizontal pixels shall be used; e.g. when up converting (received) 544x576 line resolution format to any 1:1 pixel aspect ratio (output) format, only the centred 530 pixels of the horizontal 544 shall be used.</p> <p>Upscaling of (sub-) resolutions of received video shall be made in accordance with ETSI TS 101 154, i.e.-(sub-) luminance resolutions in Reference Model Figure 5.1 within NorDig Unified IRD specification shall be up-scaled by the Decoder Format Converter into the-video raster of the Decoder Composition Output.</p> <p>Regarding the NorDig STB, the video raster shall either be a manually chosen raster of 1920x1080, 1280x720 or 720x576 or a raster automatically selected via EDID-information as desired by the HDMI Sink (iDTV/display).</p> |

| | |
|-----------------------|---|
| | <p>In addition to the raster resolutions above, the NorDig HEVC STB shall provide the raster 3840x2160.</p> <p>Regarding NorDig iDTVs, all resolutions of received video shall internally be scaled to the native resolution of the-display.</p> <p>When upscaling video with an encoded luminance resolution of 720x576 or 704x576 to any square pixel aspect ratio format (e.g. 1280x720, 1920x1080 or 3840x2160), only the centred 702 of the horizontal 720 / 704 pixels shall be used. Those 702 pixels correspond to the 52 microseconds of an active line, hence preserves correct geometry in the up-conversion process.</p> <p>When upscaling other 576 line-based input resolutions to any square pixel aspect (output) format (i.e. 1280x720, 1920x1080 or 3840x2160), only the centred horizontal pixels shall be used; e.g. when up-converting (received) 544x576 line resolution format to any-square pixel aspect ratio (output) format, only the centred 530 pixels of the horizontal 544 shall be used.</p> |

| Test procedure | <p>Purpose of test:</p> <p>When up-converting valid input line resolution format to any 1:1 pixel aspect (output) format, only the centered horizontal pixels shall be used.</p> <p>This test task 6:3 of video scaling can be made together with test task 6:2 resolution and frame rates.</p> <p>Equipment:</p> <div style="text-align: center;">  <pre> graph LR A[MPEG TS Source] --> B[MPEG MUX] B --> C[DVB modulator] C --> D[NorDig IRD] D --> E[Monitor for STB] </pre> </div> <p>Monitor for testing NorDig STB shall display a native 1920x1080 resolution, monitor for testing NorDig HEVC STB shall display a native 3840x2160 resolution.</p> <p>Source must have TS containing all the video formats listed in test results</p> <p>Transport stream containing:</p> <ul style="list-style-type: none"> • 720 x 576 video signal • 704x576 video signal • 544x576 video signal <p>Test procedure:</p> <p>Verify that only the centred horizontal pixels shall be used for up-converting valid input line resolution to 1:1 pixel output (1920x1080, 1280x720). This is 702 horizontal pixels from 720/704x576 material and 530 pixels from 544x576 material.</p> <p>Following steps:</p> <ol style="list-style-type: none"> 1. For NorDig STB/HEVC STB check that is video output raster can either be a manually chosen or a raster automatically selected via EDID-information as desired by the HDMI Sink (iDTV/display) according to NorDig requirements. 2. Play streams that contain all video formats in measurement record table below 3. Tune to services 4. Verify that the services are decoded and that video resolution scaling are displayed correctly 5. Testing shall be made upon all cases (rows) marked with "M" (mandatory) PLUS at least 3 other randomly non-mandatory selected cases (rows) from MPEG-2/AVC table below PLUS for HEVC IRDs at least 3 other randomly non-mandatory selected cases (rows) from HEVC table below. |

6. Fill in test results

Expected result:

(step 1) The NorDig STB, the video output raster **shall** either be a manually chosen raster of 1920x1080, 1280x720 or 720x576 or a raster automatically selected via EDID-information as desired by the HDMI Sink (iDTV/display).

In addition to the raster resolutions above, the NorDig HEVC STB **shall** provide the raster 3840x2160.

When up converting video with an encoded luminance resolution to any 1:1 pixel aspect ratio format, only the centred horizontal pixels shall be used.

(step 2-6) Upscaling of (sub-) resolutions of received video **shall** be up-scaled by the Decoder Format Converter into the video raster of the Decoder Composition Output. When upscaling of input video to any square pixel aspect ratio format to the output, only the centred horizontal pixels **shall** be used. This means for 720x576 or 704x576 input video content only the centred 702 of the horizontal 720 / 704 pixels **shall** be used and for 544x576 video content, only the centred 530 pixels of the horizontal 544 **shall** be used. The geometry of the original picture shall be preserved.

Test result(s)

Measurement record for all NorDig IRDs:

|-----------|--------------------------------------|
| Test Case | Task 6:4 Video Decoder - Colorimetry |
| Section | NorDig Unified 5.5 |

| | |
|-----------------------|--|
| Requirement | <p>The Decoder Format Converter shall use the VUI (Video Usability Information) parameters (ISO/IEC 14496-10) [56] colour primaries, transfer characteristics and matrix coefficients in received AVC encoded bitstreams and the Sequence Display Extension parameters (ISO/IEC 13818-2) [53] in MPEG-2 encoded bitstreams. The “Decoder Composition Output” shall output video with colour parameters targeting an ideal display, optimised for each video format. The “Decoder Composition Output” shall output video with colour parameters targeting an ideal display, optimised for each video format.</p> <p>The NorDig IRD Decoder Format Converter shall use the VUI (Video Usability Information) parameters (ISO/IEC 14496-10) colour primaries, transfer characteristics and matrix coefficients in received AVC encoded bitstreams and the Sequence Display Extension parameters (ISO/IEC 13818-2) in MPEG-2 encoded bitstreams.</p> <p>In addition to the NorDig IRD requirements above, the NorDig HEVC IRD Decoder Format Converter shall use the VUI (Video Usability Information) parameters (ISO/IEC 23008-2) colour primaries, transfer characteristics and matrix coefficients in received HEVC encoded bitstreams.</p> <p>It shall be assumed that bitstreams according to “HEVC HDR UHD TV Bitstreams using PQ10”, section 5.14.4.4.3 in ETSI TS 101 154, will provide the “Mastering Display Colour Volume SEI message”, section 5.14.4.4.3.3.2 in ETSI TS 101 154. Bitstreams carrying non-live programmes, may also contain the “Content Light Level Information SEI message”, section 5.14.4.4.3.3.3 in ETSI TS 101 154.</p> <p>Hence, it is highly recommended that the NorDig HEVC IRD Decoder Format Converter makes use of the “Mastering Display Colour Volume SEI message” when adapting to the luminance and chrominance capability of the connected display. It is in addition recommended that the NorDig HEVC IRD makes use of the “Content Light Level Information SEI message” when available in the bitstream.</p> <p>5.5.1 NorDig HEVC STB colorimetry</p> <p>The Decoder Composition Output in NorDig’s Video Decoder Reference Model (see chapter 5.1.1) shall be advanced enough to perform all video format conversions (luminance-wise and chrominance-wise) needed to target legacy HDMI-sinks, as well as EDID-enabled adaption to the capability of the connected display, including HDR capability, described in ANSI/CTA-861-G. The complete ANSI/CTA-861-G shall be taken into account except the “6.10 Extended InfoFrame” and “6.10.1 HDR Dynamic Metadata Extended InfoFrame” (1).</p> <p>When connected to a Sink (iDTV/display) of any HDMI version, the HDMI 2.0b interface in-line with ANSI/CTA-861-G will give the STB’s Video Format Converter necessary information regarding the desired colorimetry via EDID handshake. The EDID-information shall be used by the Decoder Format Converter of the NorDig HEVC STB to convert colorimetry. However, legacy SDR displays will signal their supported SDR video formats in priority without specifically signalling “Desired Content Max Luminance data” (see 7.5.13 “HDR Static Metadata Data Block” in ANSI/CTA-861-G). Hence, the Decoder Format Converter of the NorDig HEVC STB shall output SDR video formats based on the HDR to SDR conversion methods described by the ITU, e.g. ITU-R BT.2390 and operational practises in HDR television production ITU-R BT.2408.</p> |

| Test Case | Task 6:5 Video Decoder - Dynamic changes in video stream |
| Section | NorDig Unified 5.6 |
| Requirement | <p>The NorDig IRD shall be able to handle dynamic changes of either the video codec or the video format that may occur dynamically within the transmitted stream. After a change of video codec, the IRD should automatically resume decoding and output of valid video within five seconds.</p> <p>The NorDig IRD shall be able to handle dynamic changes in transmission between different video formats and frame rates (e.g. 720p50 to 1080i25/1080p25 and 576i25 to 720p50), including changes in encoded sub resolution (e.g. 720x576 to 544x576) within one second after receiving Random Access Point. (Random Access Point equals H.264/AVC RAP for H.264/AVC and Sequence header for H.262/MPEG-2).</p> <p>The NorDig IRD shall adapt to changes in transmitted aspect ratio (e.g. 16:9 / 4:3) within one second after the reception. The transition shall cause minimal disturbance of the decoded service.</p> |
| IRD Profile(s) | Basic, HEVC, all IRDs, FE |

Test procedure

Purpose of test:

To verify that the receiver is able to handle dynamic changes in transmission between different video modes.

Equipment:

Transport stream containing services with following video content **modes** and transitions **over time** between them:

- MPEG-4 AVC HP@L3 576i 25Hz, aspect ratio 4:3
- MPEG-4 AVC HP@L3 576i 25Hz, aspect ratio 16:9
- MPEG-4 AVC HP@L4 720p 50Hz
- MPEG-4 AVC HP@L4 1080i 25Hz
- MPEG-2 MP@ML 576i 25Hz, (aspect ratio 16:9)
- MPEG-4 AVC HP@L4 1080i 25Hz
- MPEG-H HEVC HD SDR 8-bit 1080p 25Hz (only HEVC IRDs)
- MPEG-H HEVC HD SDR 10-bit 1080p 25Hz (only HEVC IRDs)
- MPEG-H HEVC HD SDR 10-bit 1080p 50Hz (only HEVC IRDs)
- MPEG-H HEVC UHD SDR 10-bit 2160p 50Hz (only HEVC IRDs)
- MPEG-H HEVC UHD HDR HLG10 10-bit 2160p 50Hz (only HEVC IRDs)
- MPEG-H HEVC UHD HDR PQ10 10-bit 2160p 50Hz (only HEVC IRDs)

For the test of changing codec the transport stream shall include at least two services in case IRD needs change services and back to recover codec change.

Test services could typically be changing/toogling between two modes or one service that changes between all modes from top of the list down. Each mode could typically be for a period of 30sec or more. (For non-HEVC IRDs test service shall not contain HEVC content).

Examples of how test services could change over time:

This test can be done in parallel with Task 6:13 (4:3 content on 16:9 monitor).

Test procedure:

Tune to the service and verify that the transitions between encoding modes are reasonably smooth and that the decoding is resumed after a transition within

- Five seconds in case of codec change.
- One second in case of resolution **change**.
- One second in case of aspect ratio change (only applicable for SD content).

..

Fill in result to test results table below.

Expected result:

The IRD is able to handle mode changes.

| | |
|--|---|
| | <ul style="list-style-type: none">- Change of codec: should within 5sec, but shall at least minimum recover codec change after changing service and back (i.e. shall not require restart or re-scan).- Change of format and rate within same codec: within 1 sec- Change of aspect ratio within same codec: within 1 sec. |

|-----------|---|
| Test Case | Task 6:6 MPEG-2 Minimum video bandwidth |
| Section | NorDig Unified 5.7 |

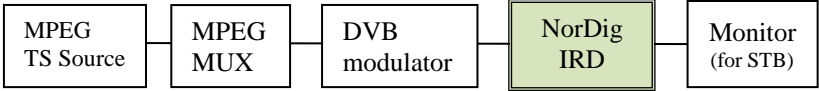

| | |
|-----------------------|---|
| Requirement | <p>The NorDig IRD shall provide support for very low bandwidth video.</p> <p>For MPEG-2 video the NorDig IRD decoder shall be able to decode at bit rates down to 1.0 Mbps for video resolutions up to full Standard Definition resolution video (720x576).</p> <p>The NorDig IRD shall be able to decode H.264/AVC video at bitrates down to 250 kbps for all resolutions up to 1920x1080. For AVC still picture the NorDig IRD shall be able to decode down to 100 kbps.</p> <p>For AVC and HEVC it is not specified any lower bandwidth limitation within MPEG/ISO or DVB specification and it is expected that all IRDs shall be able to handle very low bandwidth as long as syntax fulfil MPEG and DVB specification. For testing it is not mandatory to test AVC or HEVC streams for very low bitrate, but it can be some interest to perform the optional test of low bitrate for AVC and HEVC to verify no issues in the IRD's video decoding implementation.</p> |
| IRD Profile(s) | Basic, all IRDs, FE |
| Test procedure | <p>Purpose of test: To verify that the receiver is able to decode video streams for very low bandwidth video.</p> <p>Equipment:</p> <div data-bbox="462 963 1284 1064">  <pre> graph LR A[MPEG TS Source] --> B[MPEG MUX] B --> C[DVB modulator] C --> D[NorDig IRD] D --> E[Monitor (for STB)] </pre> </div> <p>A transport stream with following video content at:</p> <ul style="list-style-type: none"> • MPEG-2 MP@ML 720x576i 25Hz 1.0 Mbps (mandatory) • MPEG-4 AVC HP@L3 720x576i 25Hz 250 kbps • MPEG-4 AVC HP@L4 1280x720p 50Hz 250 kbps (optional) • MPEG-4 AVC HP@L4 1920x1080i 25Hz 250 kbps (optional) • MPEG-H HEVC HD SDR 10bit 1920x1080p 50Hz 250kbps (optional) • MPEG-H HEVC UHD HLG10 or PQ10 3840x2160p 50Hz 400kbps (optional) <p>Note: Optional video content (AVC and HEVC) that is not mandatory to test and if not tested not necessary to include into transport stream. But these are recommended to help IRD manufacture ensure no issues for very low bitrate with these codecs.</p> <p>Test procedure:</p> <p>Tune to the service(s) and verify that the IRD decodes very low bandwidth video correctly.</p> <p>If the 250kbps (and 400kbps for HEVC UHD) bit rate is not achieved, the tested bit rate shall be noted in comments.</p> <p>Expected result:</p> <p>The IRD supports low bitrate video as stipulated above..</p> |

| Section | NorDig Unified 5.12 | | |
| Requirement | <p>The NorDig IRDs shall have methods to display 16:9 transmitted content on a 4:3 monitor. Likewise The NorDig IRD shall have methods to display 4:3 transmitted SDTV content on a 16:9 monitor (with any resolution and colorimetry capability). The NorDig IRD shall be able to maintain full height 4:3 picture aspect ratio (pillar box) on a 16:9 display. Other display modes for 4:3 content are optional.</p> <p>If SCART is available, the user shall have the ability to select appropriate aspect ratio for the analogue video output (SCART), see section 8.4 of NorDig Unified IRD specification.</p> | | |
| IRD Profile(s) | Basic, IRD, FE | | |
| Test procedure | <p>Purpose of test: To verify that the IRD can output suitable picture signals for the 16:9 screen.</p> <p>Equipment: Test signals are created using the test bed shown below:</p>  <p>Test procedure:</p> <p>This test can be done in parallel with Task 9:2 and Task 6:5 (dynamic 4:3<->16:9).</p> <p>The IRD is tuned to a transport stream containing a 4:3 aspect ratio video service. It is verified that the receiver can deliver a maintained full height 4:3 aspect ratio (Pillarbox) video signal for the 16:9 screen.</p> <p>Expected result: Receiver can deliver a maintained full height 4:3 aspect ratio (Pillarbox) video signal for the 16:9 screen. Note: During the transition period from 4:3 to pure 16:9 transmissions, dynamical changes of the aspect ratio, e.g. 16:9 -> 4:3 -> 16:9, may occur in broadcasting. It is highly recommended that IRD can provide always correct aspect ratio.</p> | | |

|-----------------------|--|
| Test Case | Task 6:12 Rescaling for HbbTV application |
| Section | NorDig Unified 5.13 |
| Requirement | A NorDig HybridHbbTV IRD shall support rescaling as defined in HbbTV under “video scaling” minimum requirements in clause 10.2.1 of ETSI TS 102 796. These shall be supported for any of the valid incoming encoded full screen luminance resolution resolutions (see 5.2 for full screen luminance resolution values). The video shall be scaled, preserving the aspect ratio, and when applicable converted colorimetry-wise , such that all of the decoded video is visible within the area of the AV Control object or HTML5 video object . (See HbbTV requirements in ETSI TS 102 796 Appendix E4). |
| IRD Profile(s) | HbbTV IRD Hybrid, IRD, FE |
| Test procedure | This requirement is tested in test Task 16: |

| | |
|---|--|
| Test Case | Task 6:13 Dynamic update of PMT- Component priority Video (stream type) <Task moved from SI section to Video Test Tasks> |
| Section | NorDig Unified 12.6.3 |
| Requirement | <p>NorDig IRDs shall ignore advanced audio streams when it does not support such decoding those streams.</p> <p>For example, an IRD that do not include any AC-3 (down-mix) decoder, (maybe only supports pass through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritising.</p> <p>For video decoding, NorDig IRDs shall select the service’s video components, and set the default setting in accordance with the priority list in Table 6.1.</p> <p>Component priority when multiple video or audio streams are received</p> <p>The following applies for services that transmit in parallel more than one type of video/audio stream under the same service_id (e.g. simulcasting within the same service):</p> <p>For video decoding, NorDig IRDs shall select the service’s video component, and set the default setting in accordance with the priority list in Table 12.26.</p> <p>For Audio decoding, NorDig IRDs shall prioritise the service’s components according to chapter 6.5, Audio prioritisation.</p> <p>NorDig IRDs shall ignore advanced audio streams when it does not support decoding those streams. For example, an IRD that do not include any AC-3 (downmix) decoder, (maybe only supports pass-through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritisation.</p> <p>When several audio streams of the same type are received, the primary stream shall be selected in accordance with the definitions in section 6.5 (Audio Prioritising).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE HEVC, all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the receiver NorDig IRD is able select video and audio components in priority order and handle dynamic changes in service (PMT and PIDs).</p> |

Video priority and dynamic changes is tested in Task 6.xx Video.
Audio priority and dynamic changes is tested in Task 7.yy Audio (in addition to audio codec the audio priority depends upon type, format and language).
Subtitling priority is tested in Task 8 Teletext and Subtitling.

Equipment:

The idea in this test is that there is always video (and audio) available in the receiver NorDig IRD output (STB output or iDTV's integrated display and speakers) independently which input video and audio format(s) is(are) available in the service.

Depending of the audio selection settings (stereo or multichannel) in receiver menu-system receiver shall output always audio in the correct format in the physical audio output or iDTV's integrated speakers..

MPEG source must have capability to simultaneously with

* video component broadcast for following video formats:

- MPEG-2/H.262 MP@ML (SD)
- MPEG-4 AVC/H.264 HP@L4 (HD)
- ~~MPEG-4 AVC HP@L4 / L3 (SD)~~
- MPEG-H HEVC/H.265 (FullHD or UHD) - for HEVC IRDs

* audio component (recommended to have audio, e.g. MPEG-1 L.II) broadcast for following audio formats:

- ~~MPEG-1 Layer II~~
- ~~MPEG-4 HE AAC~~
- ~~AC-3~~
- ~~E-AC-3~~

| | Service1 | Service2 | | Frequency |
|---|--|---|--|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 PMT PID 1100 V PID 1109 (MPEG 2 SD) V PID 1119 (AVC HD) V PID 1129 (AVC SD) V PID 1129 (HEVC) A PID 1108 (audio) (MPEG1 L2) A PID 1118 (HE AAC) A PID 1128 (E-AC 3) A PID 1138 (AC 3) Logical_chan_desc 1 visible | SID 1200 S_name Test12 PMT PID 1200 V PID 1209 incl PCR A PID 1208 Teletext PID 1207 DVB Subt PID 1106 Logical_chan_desc 2 visible | | Can be chosen depending of the distribution media |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network)

The service PCR is broadcasted in separate PID.

Test procedure:

1. Control that the MUX1 have services signaled as defined in table above
2. Zap all the services and check quickly that they works.
3. Zap to service1 in MUX1
4. Drop PIDs in following order (i.e. remove PID and its signaling in PMT and stop video PID in TS):
 - a. Video PID 1119 (MPEG4/AVC HD)
 - b. Video PID 1129 (MPEG-H HEVC)
 - c. ~~Audio PID 1118~~
 - d. ~~Audio PID 1128~~
 - e. ~~Audio PID 1138~~
5. Add PIDs in following order (i.e. add PID and its signaling in PMT and add audio PID in TS):
 - a. Video PID 1129 (MPEG-H HEVC)
 - b. Video PID 1119 (MPEG4/AVC HD)
 - c. ~~Audio PID 1138~~
 - d. ~~Audio PID 1128~~
 - e. ~~Audio PID 1118~~
6. Verify that the service is decoded correctly by watching the video, listening the audio

Expected result:

~~HDTV receiver~~ NorDig HEVC IRD: After remove and addition of the PIDs, all the component in the service are decoded correctly.

~~SDTV receiver~~ Basic (non-HEVC) IRD: stream_types not supported by the receiver are not affecting the receiver operability.

Test result(s)

Video codecs:

| Video codec | Stream_type | Priority | OK/NOK |
|--|-------------|-------------|--------|
| MPEG-4 AVC HP@L4 HD video stream | 0x1B | 1 (highest) | |
| MPEG-4 AVC HP@L4 / L3 SD video stream | 0x1B | 2 | |
| Basic, MPEG-2 MP@ML video stream (or MPEG1) | 0x02 (0x01) | 3 (lowest) | |

| Video codec | Stream_type | Priority | OK/NOK |
|--|-------------|-------------|--------|
| HEVC/H.265 up to UHD HDR SFR video stream (incl first PID in dual PID HFR) (1) | 0x24 | 1 (highest) | |
| AVC/H264 HP@L4 / L3 HD or SD video stream | 0x1B | 2 | |
| MPEG-2/H264 MP@ML video stream (or MPEG1) | 0x02 (0x01) | 3 (lowest) | |

Audio codecs:

| Audio-codec | Stream-type | Priority | OK/NOK |
|---|-------------|-------------|--------|
| MPEG-4 HE-AAC (or LC-AAC) v2 audio stream | 0x11 | 1 (highest) | |
| E-AC-3 (Enhanced AC-3) audio stream | 0x06 | 2 | |

| Test Case | Task 7:18 HE AAC: required output formats for HDMI output, and HDMI ARC interface and HDMI eARC |
| Section | NorDig Unified 6.2.3.43 |
| Requirement | <p>Where HDMI, HDMI ARC (or eARC) is implemented, NorDig IRDs supporting HE-AAC shall be capable of providing the following formats on the HDMI output connector from a HE-AAC bitstream (see chapter 16 for factory default settings):</p> <ul style="list-style-type: none"> • Transcoded to AC-3 or DTS bitstream • Decoded and downmixed (if > 2 channels) to PCM stereo bitstream |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs with option for HDMI, or HDMI ARC, or HDMI eARC |
| Test procedure | <p>Purpose of test:</p> <p>To verify that receiver IRD decodes/transcodes and passes-through HE AAC bitstream. When HE AAC bitstream is decoded and transcoded the audio output level can be adjusted.</p> |

This test is only relevant for **STB IRDs** with HDMI output and **iDTV IRDs** with HDMI ARC and/or HDMI eARC output.

Equipment:

A transport stream contains:

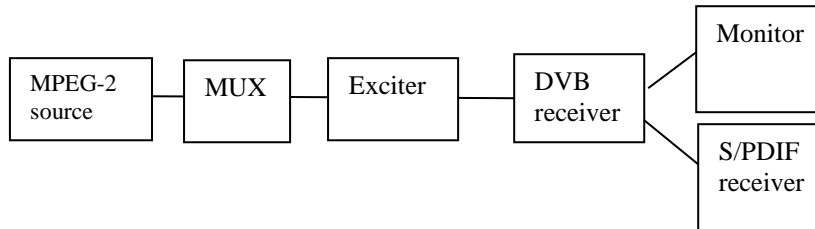

- a service with HE AAC Level2 @48kHz (mono, stereo) audio component with relevant signaling.
- a service with HE AAC Level 4 @48kHz (multichannel) audio component with relevant signaling.

Test procedure:

1. Connect the IRD to HDMI (ARC, eARC) receiver e.g. Home Theater System with HDMI (ARC, eARC).
2. Verify that services are available.
3. In receiver menu, select stereo audio.
4. Select service with HE AAC Level2@48kHz (stereo).
5. Verify that HE AAC stereo is transcoded to PCM stereo audio bitstream at HDMI (ARC, eARC) output and HDMI ARC.
6. Verify the audio output level can be adjusted.
7. Select service with HE AAC Level4@48kHz (multichannel)
8. Verify that HE AAC multichannel is downmixed to PCM stereo at HDMI (ARC, eARC) output and HDMI ARC.
9. Verify the audio output level can be adjusted.
10. In receiver menu, select multichannel audio.
11. Verify that HE AAC multichannel is transcoded to AC-3 or DTS multichannel at HDMI (ARC, eARC) output. and HDMI ARC

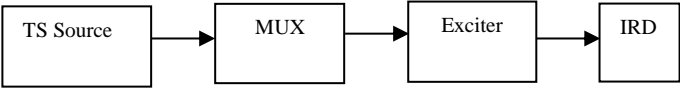

Expected result:

| | |
|-----------------------|--|
| | IRD supports HE AAC stereo audio decoding to PCM stereo bitstream at its HDMI output and HDMI ARC when stereo audio is selected. The audio output level can be adjusted. IRD supports HE AAC multichannel audio transcoding to AC-3 and/or DTS at its HDMI output and HDMI ARC when multichannel is selected. |

| Test Case | Task 7:21 Audio prioritizing for non-NGA streams - Audio language support |
| Section | NorDig Unified 6.5, 6.5.1.1 6.5.1, 6.5.3, 16.2.3 |
| Requirement | <p>The user shall be able to select storable preferences for primary and secondary audio language. If an audio-stream according to the primary audio language preference is not associated with the chosen service the NorDig IRD shall automatically choose the audio stream according to the secondary audio language preference, if present. In addition the user shall be able to manually select between all audio-streams that are associated with the active service.</p> <p>For prioritisation between non-NGA audio PIDs/streams (for non-NGA capable NorDig IRDs or NGA capable NorDig IRDs that has not prioritised NGA stream(s) according to section 6.5.2), the audio source priority shall be based on the property of the supported audio streams and for different user preference settings of audio format and audio type</p> |

| | |
|--|---|
| | as selected by the user according with table 6.1 below. See section 16.4 for factory default user preference settings related to audio. |
| | For the selection of audio language (see Table 6.1 and Table 6.2), the NorDig IRD shall use the ISO 639 language code from the supplementary audio descriptor (1) and/or the ISO 639 language descriptor. |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To verify the support for primary and secondary audio language.</p> <p>Equipment:</p>  <pre> graph LR A[MPEG 2-source] --- B[DVB-S/C/T Modulator] B --- C[Up Converter] C --- D[DVB Receiver] D --- E[Monitor] </pre> <p>Transport stream containing at least one service with two audio languages. Suitable languages are Swedish, Finnish, Norwegian, Danish, Icelandic, Sami, Irish/Gaelic and English.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Verify a service with two different audio components is broadcasted dedicated for test of Nordic languages 2. Verify the audio components are signaled correctly. 3. Verify it is possible to select and setup primary and secondary audio language in the receiver setup. 4. Verify the receiver selects the correct audio for primary language. 5. Drop the audio component selected as primary audio language in receiver. 6. Verify the receiver selects correct audio component, i.e. secondary audio language. <p>Expected result: It shall be possible to select primary and secondary language. If the selected primary language is not broadcasted, the selected secondary audio language shall be selected automatically.</p> |

|--------------------|---|
| Test Case | Task 7:22 Audio Prioritising for non-NGA streams – audio format and stream type |
| Section | NorDig Unified 6.5, 16.2.3 |
| Requirement | The NorDig IRD shall be able to select audio stream according to user selections, these settings should be stored in the IRD's memory separately for each service. If manually selected audio is not able to be stored in the IRD's |

| | |
|--|---|
| | <p>memory per service, a global setting should be made possible to set manual prioritisation of stream type for all services. The priority for the selected audio source shall be based on the user selections and audio stream shall be selected according to the priority list in table 6.1 below. If the user selections are not matching with the audio streams, the NorDig IRD shall always select one of the audio streams which closest suites with the user selections and will hereby provide audio to end-user.</p> <p>In the event that the NorDig IRD finds more than one stream with same audio property parameters (type, language, format and stream type) that fully or partially matches the IRD user preference settings, of the remaining streams (which have the same audio properties), the stream with the lowest PID shall be selected.</p> <p>The user shall be able to select multi-channel audio for the digital outputs, when the outputs are equipped for multichannel audio.</p> <p>If multichannel mode is selected and if both multichannel and stereo streams are available for the selected language and audio type, the NorDig IRD shall use the multichannel audio stream to provide downmixed audio in analog audio output(s), if applicable, and suitable digital bitstream format in digital audio output(s) as e.g. in examples in Annex G (Example table when more than one audio codec is received).</p> <p>If stereo mode is selected and if both multichannel and stereo streams are available for the selected language and audio type, the NorDig IRD shall use the stereo audio source to provide audio in analog audio output(s), if applicable, and PCM stereo in digital audio output(s) as e.g. in examples in Annex G (Guidelines for NorDig IRD audio selection: “Example table when more than one audio stream is received”).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To verify the audio priority selection and output audio format.</p> <p>Test Equipment:</p>  <pre> graph LR TS[TS Source] --> MUX[MUX] MUX --> Exc[Exciter] Exc --> STB[STB] STB --> AD[Audio decoder] </pre> <p>Transport stream containing services with audio components (same language and audio type) listed in table below in test results.</p> <p>Suitable languages are Swedish, Finnish, Norwegian, Danish, Icelandic, Sami, Irish/Gaelic and English.</p> <p>Audio type is “normal”.</p> <p>Audio format and stream type shall be signaled in AAC_descriptor, AC-3_descriptor or E-AC-3_descriptor according to following:</p> <ol style="list-style-type: none"> 1) the AAC_type field in the AAC_descriptor for AAC audio, 2) the number of channels flags in the AC-3 descriptor and Enhanced AC-3 descriptor for AC-3 and E-AC-3. |

Correct signaling is broadcasted depending of the audio format and stream type in test results table. IRD is assumed to prioritise audio format and stream type according to list above.

Test procedure:

1. Setup the system
2. Verify that the audio selection is done correctly according the input formats in table below in test results
3. Repeat test with all input format in table below
4. Fill in test results

Expected result:

The IRD shall select the audio format and stream type correctly.

Test result(s)

| Test Case | Task 7:23 Audio Prioritising for non-NGA streams – audio type |
| Section | NorDig Unified 6.5 16.2.3 |
| Requirement | <p>The NorDig IRD shall be able to select audio stream according to user selections, these settings should be stored in the IRD's memory separately for each service. If manually selected audio is not able to be stored in the IRD's memory per service, a global setting should be made possible to set manual prioritisation of stream type for all services. The priority for the selected audio source shall be based on the user selections and audio stream shall be selected according to the priority list in table 6.1 below. If the user selections are not matching with the audio streams, the NorDig IRD shall always select one of the audio streams which closest suites with the user selections and will hereby provide audio to end-user.</p> <p>In the event that the NorDig IRD finds more than one stream with same audio property parameters (type, language, format and stream type) that fully or partially matches the IRD user preference settings, of the remaining streams (which have the same audio properties), the stream with the lowest PID shall be selected.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | Purpose of test: Verify that IRD selects normal/undefined (0x00) audio component by default. |

Equipment:

The TS must contain two services with several audio components for the same language, audio formats and stream type but different audio types.

Suitable languages are Swedish, Finnish, Norwegian, Danish, Icelandic, Sami, Irish/Gaelic and English.

Audio type is signaled in PMT in one or all of the following descriptors:

- 1) Supplementary_audio_descriptor for any stream type.
- 2) AAC_descriptor for AAC audio.
- 3) AC-3 descriptor for AC-3 audio.
- 4) Enhanced AC-3 descriptor for E-AC-3 audio.
- 5) ISO639_descriptor for any stream type.

IRD is assumed to prioritise the audio type signalization information in that order.

Audio format is stereo.

Stream type for all audio components is either MPEG-4 HE.AAC version 1 or E-AC-3 including metadata corresponding audio_type.

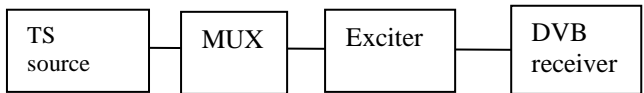

| | Service1 | Service2 | Frequency |
|---------------------|---------------------------------------|---------------------------------------|---|
| MUX | SID 1100 | SID 1200 | Can be chosen depending of the distribution media |

| | Audio_type visual impaired commentary | Audio_type visual impaired commentary | |
| | A PID 1106 | A PID 1206 | |
| | ISO639_language_code ²⁾ | ISO639_language_code ²⁾ | |
| | Audio_type Normal/Undef | Audio_type Normal/Undef | |
| | LCD 1 visible | LCD 2 visible | |

- 1) ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.
- 2) Language must the same for all audio components and it can be one of the swe/fin/nor/ice/dan/smi/gle/iri/eng/und

Test procedure:

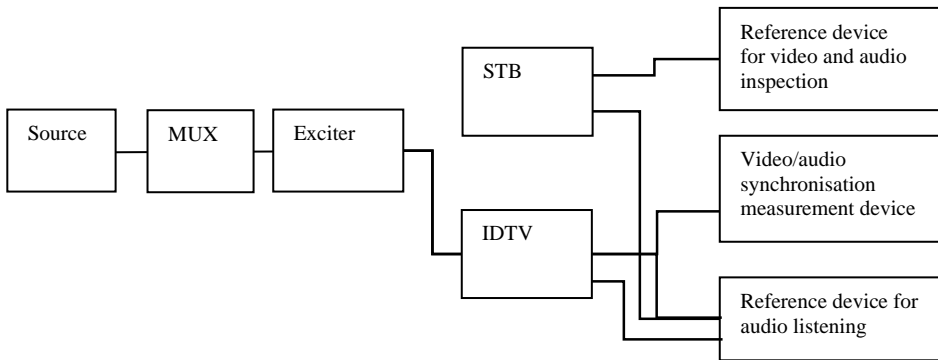

1. Verify the receiver selects audio component which has normal/undefined audio by default
2. Verify user is able to select different audio components.
3. Verify that the user is able to store selected audio component in the IRD's non-volatile memory, or can be set by changing the priority defined in list in table 6.1.
4. Put IRD into standby mode and unplug the power cord
5. Turn on the IRD
6. Zap to different service and verify that the IRD is selecting wanted audio.

| | | | |
|-----------------------|--|-------------|--|
| | Expected result: IRD selects the audio component that is signalled as Normal/Undefined (0x00) by default when several audio components with the same language code, audio format and stream type but different audio type are available within one service. The user shall also be able to select between the different audio components. The user should also be able to store the selected audio component prioritisation to non-volatile memory. | | |

|--------------------|--|
| Test Case | Task 7:29 Dynamic update of PMT- Component priority (stream type) |
| Section | NorDig Unified 12.6.3, 6.5.2, 6.5.3 |
| Requirement | From 12.6.3: Component priority when multiple video or audio streams are received |

| | |
|--|---|
| | <p>The following applies for services that transmit in parallel more than one type of video/audio stream under the same service_id (e.g. simulcasting within the same service): [...]</p> <p>For Audio decoding, NorDig IRDs shall prioritise the service's components according to chapter 6.5 (Audio Prioritisation).</p> <p>NorDig IRDs shall ignore advanced audio streams when it does not support decoding those streams. For example, an IRD that do not include any AC-3 (downmix) decoder, (maybe only supports pass-through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritisation.</p> <p>When several audio streams of the same type are received, the primary stream shall be selected in accordance with the definitions in section 6.5 (Audio Prioritisation).</p> <p>From 6.5.2:</p> <p>NGA capable NorDig HEVC IRD shall prioritise the selection of NGA/AC-4 audio PID/stream over other audio PIDs/streams using other audio codecs when:</p> <ul style="list-style-type: none"> • NGA stream signalised a language that matches IRD user preference settings for primary audio language. (See section 6.5.4.1 how IRD shall detect language for PMT signalling), or • NGA stream does not signalise any language (in PMT), or • No NGA stream matches the user preference settings for primary audio language and no non-NGA stream matches the IRD user preference settings for primary and secondary audio language. <p>Otherwise, the non-NGA audio PIDs/streams shall be selected in accordance with section 6.5.3 below.</p> <p>From 6.5.3:</p> <p>For prioritisation between non-NGA audio PIDs/streams (for non-NGA capable NorDig IRDs or NGA capable NorDig IRDs that has not prioritised NGA stream(s) according to section 6.5.2), the audio source priority shall be based on the property of the supported audio streams and for different user preference settings of audio format and audio type as selected by the user according with table 6.1 below.</p> |
| IRD Profile(s) variants and capability | HEVC, all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the NorDig IRD is able select audio components in priority order and handle dynamic changes in service (PMT and PIDs).</p> <p>The idea in this test is that there is always (video and) audio available in the NorDig IRD output (STB output or iDTV's integrated display and speakers) independently which input audio format(s) is(are) available in the service.</p> <p>Equipment:</p> <div data-bbox="461 1787 1102 1879" data-label="Diagram">  <pre> graph LR A[MPEG source] --> B[MUX 1] B --> C[Exciter] C --> D[DVB receiver] </pre> </div> <p>The IRD shall be configured with stereo output mode and normal audio mode. The IRD shall output audio in the correct format in the physical audio output or iDTV's integrated speakers.</p> |

Depending of the audio selection settings (stereo or multichannel) in receiver menu system receiver shall output always audio in the correct format in the physical audio output or iDTV's integrated speakers...

MPEG source must have capability to produce video simultaneously with

* audio component broadcast for following audio formats:

- MPEG-1 Layer II
- MPEG-4 HE AAC
- AC-3
- E-AC-3
- AC-4 (for HEVC IRDs)

Audio streams shall be stereo, normal audio and the same language.

| | Service1 | Service2 | | Frequency |
|---|---|--|--|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 PMT PID 1100 V PID 1109 (MPEG 2 SD) V PID 1119 (AVC HD) V PID 1129 (AVC SD) A PID 1108 (MPEG1 L2) A PID 1118 (HE AAC) A PID 1128 (E-AC-3) A PID 1138 (AC-3) A PID 1148 (AC-4) Logical_chan_desc 1 visible | SID 1200 S_name Test12 PMT PID 1200 V PID 1209 incl PCR A PID 1208 Teletext PID 1207 DVB Subt PID 1106 Logical_chan_desc 2 visible | | Can be chosen depending of the distribution media |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network)

The service PCR is broadcasted in separate PID.

Test procedure:

7. Control that the MUX1 have services signaled as defined in table above
8. Configure the IRD for stereo output and normal audio mode
9. Zap all the services and check quickly that they works.
10. Zap to service1 in MUX1
11. Drop PIDs (and update PMT accordingly) in following order:
 - a. Audio PID 1118 (HE-AAC)
 - b. Audio PID 1128 (AC-3)
 - c. Audio PID 1138 (E-AC-3)
 - d. Audio PID 1148 (AC4)
12. Add PIDs (and update PMT accordingly) in following order:
 - a. Audio PID 1148 (AC4)
 - b. Audio PID 1138 (E-AC3)
 - c. Audio PID 1128 (AC3)
 - d. Audio PID 1118 (HE-AAC)
13. Verify that the service is decoded correctly by watching the video, listening the audio

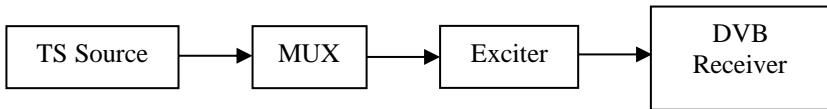

Expected result:

~~HDTV receiver~~ NorDig HEVC IRD: After remove and addition of the PIDs, all the component in the service are decoded correctly.

| | SDTV-receiver Basic (non-HEVC) IRD: stream_types not supported by the receiver are not affecting the receiver operability. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| PID | Codec | Language signaling | Content | | | | | | | | | | | | | | | | | | |
| 1st audio PID | HE-AAC | Swedish | Sine tone | | | | | | | | | | | | | | | | | | |
| 2nd audio PID | HE-AAC | Swedish Audio Description | Speech* | | | | | | | | | | | | | | | | | | |
| 3rd audio PID | AC-4 | 5 Presentations: Finnish Swedish Swedish (SpS) Swedish (AD+SpS) Swedish (AD) | Finnish: music Swedish: : Immersive channel check and speech* | | | | | | | | | | | | | | | | | | |
| 4th audio PID | HE-AAC | English | White noise | | | | | | | | | | | | | | | | | | |

| | | | | |
|-------------------|---|--|--|---------------|
| | 6. In the IRD user preference settings, set the primary and secondary audio language to any languages other than Swedish, Finnish or English. 7. Verify the IRD selects the 3rd audio PID and plays back the content corresponding to Finnish language. | | | |
| | Expected result: There are three verification steps in this test procedure: In step 3, the IRD prioritises the NGA PID because it matches the user preference for primary audio language. In step 5, the IRD prioritises the non-NGA PID because the NGA PIDs don't match the user preference for primary audio language and the non-NGA PID does. In step 7, the IRD prioritises the NGA PID because neither the NGA nor the non-NGA PIDs match the user preference for primary audio language. | | | |
| | Test result(s) | Primary/secondary language preference | Decoded audio stream | OK/NOK |
| | | Swedish | NGA presentation corresponding to Swedish language | |
| | English | HE-AAC PID corresponding to English language | | |
| | Any languages other than Swedish, Finnish or English | NGA presentation corresponding to Finnish language | | |

| Table 2.4 Audio Priority between NGA Preselections for NGA “Accessibility Services” with Audio description on/off and Spoken Subtitles on/off. A lower number refers to higher priority. | | | | | |
| Note 1: This selection requires the IRD to evaluate the audio preselection descriptor. | | | | | |
| IRD variants and capability | HEVC IRD | | | | |
| Test procedure | Purpose of test: To verify that the IRD selects the right preselection based on IRD primary language setting. | | | | |
| | Equipment: | | | | |

A transport stream containing a service with multiple audio PID in different languages and audio codecs as specified in the table below. Note that the content is that of the reference streams and might be replaced by the tester.

| PID | Codec | Language signaling | Content |
|---------------|--------|---|--|
| 1st audio PID | HE-AAC | Swedish | Sine tone |
| 2nd audio PID | HE-AAC | Swedish Audio Description | Speech* |
| 3rd audio PID | AC-4 | 5 Presentations: Finnish Swedish Swedish (SpS) Swedish (AD+SpS) Swedish (AD) | Finnish: music Swedish: Immersive channel check and speech* |

* Speech content is a narration in English indicating the selected language and audio type

The NGA PID contains multiple preselections in different languages, including Accessibility services.

1. Finnish preselection with music as content
2. Swedish preselection with Immersive channel check as content
3. Swedish (Audio Description) preselection with Immersive channel check and speech* as content
4. Swedish (Spoken Subtitles) preselection with Immersive channel check and speech* as content
5. Swedish (Audio Description and Spoken Subtitles) preselection with Immersive channel check and speech* as content

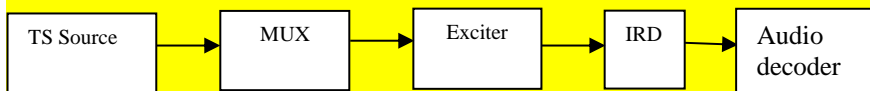

* Speech content is a narration in English indicating the selected language and audio type

Test procedure:

1. Setup the system as indicated in the diagram
2. In the IRD user preference settings, set the primary audio language to Swedish
3. Verify the IRD selects the second preselection and plays back the content corresponding to Swedish language.
4. In the IRD user preference settings, set the primary audio language to Icelandic and the secondary audio language to Finnish
5. Verify the IRD selects the third preselection and plays back the content corresponding to Finnish language.
6. In the IRD user preference settings, set the primary audio language to Swedish and enable accessibility settings for Audio Description.
7. Verify the IRD selects the fourth preselection and plays back the mix corresponding to Swedish language with Audio Description
8. In the IRD user preference settings, set the primary audio language to Swedish and enable accessibility settings for Spoken Subtitles.
9. Verify the IRD selects the fourth preselection and plays back the mix corresponding to Swedish language with Spoken Subtitles

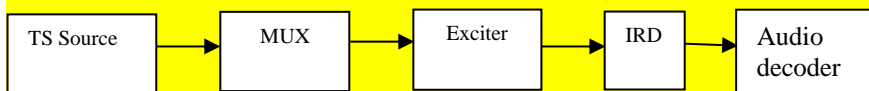

| | | | | | |
|-------------------|---|--|-------------------------------|--|---------------|
| | 10. In the IRD user preference settings, set the primary audio language to Swedish and enable accessibility settings for both Audio Description and Spoken Subtitles. | | | | |
| | 11. Verify the IRD selects the fourth preselection and plays back the mix corresponding to Swedish language with Audio Description and Spoken Subtitles | | | | |
| | Expected result: There are five verification steps in this procedure to verify the IRD implements audio prioritisation inside the NGA PID including language and Accessibility preferences. | | | | |
| | Test result(s) | Primary/secondary language preference | Accessibility settings | Decoded audio stream content | OK/NOK |
| | | Primary: Swedish | AD off SpS off | NGA presentation corresponding to Swedish language | |
| | | Primary: Icelandic Secondary: Finnish | AD off SpS off | NGA presentation corresponding to Finnish language | |
| | | Primary: Swedish | AD on SpS off | NGA presentation corresponding to Swedish language with Audio Description | |
| | | Primary: Swedish | AD off SpS on | NGA presentation corresponding to Swedish language with Spoken Subtitles | |
| | | Primary: Swedish | AD on SpS on | NGA presentation corresponding to Swedish language with Audio Description and Spoken Subtitles | |

| | |
|------------------------------------|---|
| Test Case | Task 7:46 Audio Prioritisation inside the NGA Audio PID/stream based on information from elementary stream |
| Section | NorDig Unified 6.5.6 |
| Requirement | <p>Audio Prioritisation inside the NGA Audio PID/stream can be done based on the Audio Preselection Descriptor or based on the ac4_toc, as specified in ETSI TS 103 190–2 in the elementary stream.</p> <p>The information from the elementary stream (ac4_toc) shall be used for audio prioritisation inside the NGA audio PID/stream based on the user preference settings (1). For manual selection, the information from the Audio Preselection Descriptor (APD) shall be used (1).</p> <p>The NGA audio stream(s) may contain additional or fewer preselections than those listed in the Audio Preselection Descriptor.</p> <p>If the presentation corresponding to a manually selected preselection from the Audio Preselection Descriptor is not found in the bitstream, then the IRD shall fall back to preference-based presentation selection based on IRD settings and signaling in the elementary stream as specified above.</p> <p>Note 1: Optional for NorDig HEVC IRDs launched before 1 July 2020.</p> |
| IRD variants and capability | HEVC IRD |
| Test procedure | <p>Purpose of test: To verify that the audio prioritization logic uses the information in the AC-4 TOC when the audio_preselection_descriptor contains inaccurate information.</p> <p>Equipment:</p> <div style="text-align: center;">  <pre> graph LR TS[TS Source] --> MUX[MUX] MUX --> Exc[Exciter] Exc --> IRD[IRD] IRD --> AD[Audio decoder] </pre> </div> <p>Two transport streams containing the same AC-4 elementary stream but different signaling in the PMT. The list of preselections in the audio_preselection_descriptor does not match the AC-4 TOC accurately.</p> <p>1. The audio_preselection_descriptor contains only a subset of the preselections in the AC-4 TOC that doesn't include presentation 11 (language 2, e.g. Swedish)</p> |

2. The audio_preselection_descriptor contains all of the preselections in the AC-4 TOC and one more that is not found in the bitstream. That is preselection_id 14: language 2, e.g. Swedish with Audio Description

AC-4 TOC:

| # | AC-4 TOC | Content |
|---|--|---|
| 1 | presentation_id: 10 content_classifier: 000b (Complete Main) language 1, e.g. en (English) | Immersive channel check |
| 2 | presentation_id: 11 content_classifier: 000b (Complete Main) language 2, e.g. sv (Swedish) | Noise |
| 3 | presentation_id: 12 content_classifier: 000b (Complete Main) language 1, e.g. en (English) | Cinematic content |
| 4 | presentation_id: 13 content_classifier: 010b (Visually Impaired) language 1, en (English) | Immersive channel check + speech (narration for Audio Description) |

Note that the content is that of the reference streams and might be replaced by the tester.

Test procedure:

Execute the following procedure for each of the two transport streams.

1. Setup the system as indicated in the diagram
2. Set Swedish as the preferred audio language and enable Audio Description
3. Play the transport stream
4. Verify that the IRD selects the second preselection (language 2, e.g. Swedish) and plays the corresponding content.

Additionally, for the second transport stream:

5. If the IRD offers a list of available preselections including language 2, e.g. Swedish with Audio Description, verify that manually selecting it also results in the playback of the second preselection (language 2, e.g. Swedish).

Expected result:

The list of preselections in the AC-4 TOC is always accurate, whereas the Audio Preselection Descriptor (APD) might occasionally miss some preselections or include others that are no longer available. In step #4, the IRD uses the information from the AC-4 TOC for audio prioritisation based on user preferences. Particularly:

1. In the first transport stream, no Swedish preselection is signaled in the APD. However the IRD selects it, being the closest to the user preferences of Swedish with Audio Description (AD).
2. In the second transport stream, even if a Swedish preselection with AD is signaled in the APD, it's not available. Hence the IRD selects the Swedish preselection without AD and not the English one.

In step #5, the IRD falls back to preference-based presentation selection due to a manual selection of a preselection that is not found in the elementary stream.

| Test result(s) | Test | OK/NOK |
|--------------------|--|--------|
| Transport Stream 1 | APD missing preselections from AC-4 stream | |
| Transport Stream 2 | APD with extra preselections not present in AC-4 stream | |
| Transport Stream 2 | Manual selection falls back to preference-based | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO | |

2.8 Task 8: Teletext and subtitling

Recommended order of testing (a number of early tests/requirements (e.g. priority) depends upon that the IRD supports requirements in later tests (for example different subtitling formats)):

- **First block:**
- Task 8:1 Subtitling - user preferences
- Task 8:8 EBU Teletext - General (level 1.5)
- Task 8:9 EBU Teletext - Additional requirements for Analogue video Interface
- Task 8:10 EBU Teletext decoding method (OSD)
- Task 8:11 EBU Teletext – teletext pages
- Task 8:12 EBU Teletext – teletext pages - cache
- Task 8:13 EBU Teletext – teletext subtitling
- Task 8:14 DVB Subtitling – Subtitling and subset
- Task 8:15 TTML Subtitling
- **Second block:**
- Task 8:2 Subtitling - Only display subtitling if match language in user preferences
- Task 8:3 Subtitling - Temporary changes to subtitling settings
- Task 8:4 Subtitling – Subtitling mode (Normal and Hard of hearing subtitling)
- Task 8:5 Subtitling – Subtitling priority (DVB/EBU/TTML)
- Task 8:6 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext
- Task 8:7 Subtitling - Simultaneous Subtitling and HbbTV

General pre-conditions for all Teletext and subtitling tests, ensure the NorDig IRD user preference settings at start up:

- Subtitling primary language: lang1 (for example 'Swedish')
- Subtitling secondary language: lang2
- translation dialogue/normal subtitling ON (i.e. same as factory default)and
- Hard-of-hearing subtitling OFF (i.e. same as factory default).

| | |
|---|---|
| Test Case | Task 8:1 Subtitling - user preferences |
| Section | NorDig Unified 7.1 and 7.1.2 |
| Requirement | <p>7.1 Teletext and Subtitling General</p> <p>NorDig IRD shall support DVB Subtitling (ETSI EN 300 743 and EBU Teletext Subtitling (ETSI EN 300 706).</p> <p>NorDig HEVC IRDs shall also support TTML subtitling (ETSI EN 303 560), (TTML is optional for NorDig HEVC IRD released before 1 November 2019. TTML is primarily intended to be used for MPEG-H/HEVC based services).</p> <p>The user shall be able to enable and disable displaying of subtitles and to select primary and secondary subtitling language.</p> <p>The NorDig IRD shall be capable of decoding one subtitle-stream at a time; it is not expected that the IRD shall display more than one subtitle stream. <i>In case of multiple subtitle types within the same elementary stream/PID, it is up to the broadcaster to ensure that all necessary subtitle types are included in the appropriate subtitle-streams in order to match their editorial intent (for example a hard-of-hearing stream could therefore include hard-of-hearing subtitles plus translation subtitles).</i></p> <p>The NorDig HbbTV IRD shall support Subtitling preferences and requirements also for broadband distributed content where applicable.</p> <p>7.1.2. Subtitling User preferences</p> <p>The NorDig IRD shall at least have user selection of subtitling preferences for 'translation dialogue' ('normal') and 'hard of hearing' subtitles. The NorDig HEVC IRD should also have user selection of subtitling preferences for 'non-translation dialogue' subtitles. NorDig HEVC IRDs not supporting subtitling preferences for 'non-translation dialogue' subtitles, should instead group incoming 'hard-of-hearing' and 'non-translation dialogue' subtitles into the 'hard-of-hearing' IRD setting (see table 7.3 in section 7.1.6 below).</p> <p>The IRD may also have user preference settings for 'content-related commentary' subtitling.</p> <p>The user preference settings for subtitling should be common for EBU Teletext subtitling and, DVB Subtitling, and TTML Subtitling (NorDig HEVC), see section 16 of NorDig Unified IRD specification for factory default settings of the subtitling.</p> <p>Note: Correct functionality for the Hard of Hearing/hearing impaired service, requires that the Content Providers delivers this service as a mix of translated subtitling and Hard of Hearing/hearing impaired subtitling.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs, all FE |
| Test procedure | <p>7.1 (General) This is a general requirement which will be verified in the following test tasks in Task 8.</p> <p>7.1.2 (User preference) This is tested with Task 17: User Preferences.</p> <p>For Teletext and Subtitling part the NorDig IRD shall at least have user preferences settings for:</p> <ul style="list-style-type: none"> - Primary and secondary subtitling language settings, - Subtitling ('normal'/translation dialogue) - Subtitling hard-of-hearing (hearing impaired) |

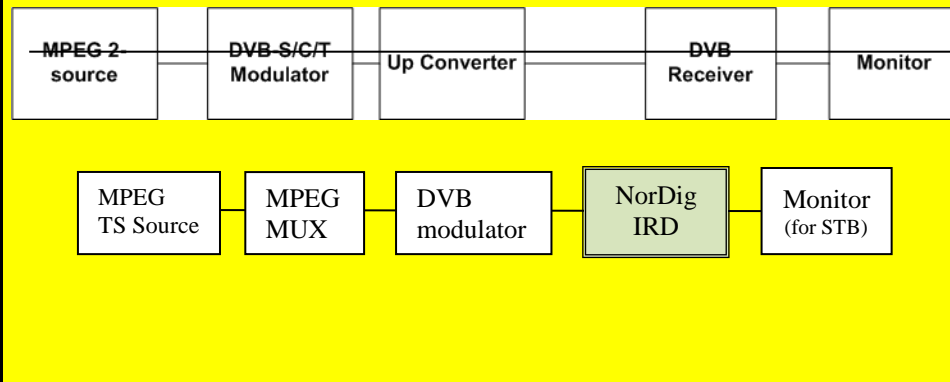

| | |
|---|---|
| Test Case | Task 8:2 Subtitling - Only display subtitling if match language in user preferences |
| Section | NorDig Unified 7.1.23 |
| Requirement | The NorDig IRD shall only display subtitles, if a language of the received subtitle matches any of the NorDig IRD's user preference settings for language for subtitling. (This means that if none of the languages for the received subtitle(s) match any of the IRD's user preference settings language for subtitling, then the NorDig IRD shall not display any subtitles). |
| IRD Profile(s) variants and capability | Basic, IRD, FE HEVC, all IRDs, all FE |

Test procedure

Purpose of test:

To verify that the IRD only display subtitles, if a language of the received subtitle matches any of the IRD's user preference settings for language for subtitling.

Equipment:

Test signal configuration:

A transport stream is used as a test signal. Within transport stream at least ~~two~~ a number of pairs of services are carried with subtitling components. For each pair of services one of the services shall match with the subtitling language (translation dialogue/normal) settings in IRD and the other service is not matching to any language settings. (Recommended that test services with matching subtitling language to the IRD setting also contain several subtitling languages, in order to combine test with Test Case Temporary changes to subtitling settings).

| Service | Containing following subtitling formats |
|---------------------|--|
| Service1 /mode 1 | EBU Teletext subtitling (normal, lang 1) |
| Service2 /mode 2 | EBU Teletext subtitling (normal, lang 3) |
| Service3 /mode 3 | DVB Subtitling (normal, lang 1) |
| Service4 /mode 4 | DVB Subtitling (normal, lang 2) |
| Service5 /mode 5 | DVB Subtitling (normal, lang 3) |
| Service6 /mode 6 | TTML Subtitling (normal, lang 1) (HEVC IRD only) |
| Service7 /mode 7 | TTML Subtitling (normal, lang 3) (HEVC IRD only) |

Ensure the NorDig IRD user preference settings at start up:

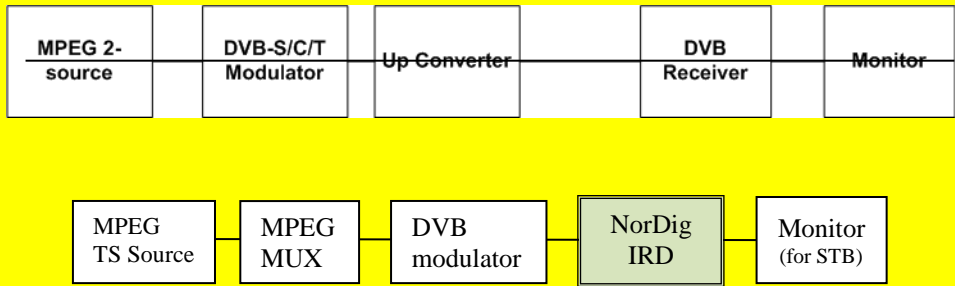

- Subtitling primary language: lang1 (for example 'Swedish')
- Subtitling primary language: lang2 (for example 'English')
- translation dialogue/normal subtitling ON and
- should have Hard-of-hearing subtitling OFF.

Test procedure:

1. Tune IRD to a service that includes subtitling service that matches the IRD language settings.
2. Verify that the correct subtitling is selected
3. Tune IRD to a service that includes subtitling service that DO NOT match the IRD language settings.

| | | | |
|-----------------------|---|--|---------------|
| | 4. Verify that the NO subtitling is selected | | |
| | Expected results: The IRD do not display any subtitling if the user preference’s subtitling language do not match with the broadcasted subtitling languages. | | |
| Test result(s) | Measurement record for the NorDig IRD/HEVC IRD: | | |
| | Service Subtitling format | Excepted IRD behaviour | OK/NOK |

| | |
|---|--|
| Test Case | Task 8:3 Subtitling - Temporary changes to subtitling settings |
| Section | NorDig Unified 7.1.34 |
| Requirement | In case of the user has made temporary changes of the subtitling settings (i.e. without changing the NorDig IRD's user preference setting), then this change shall (at least) remain until the user change service. (Clarification, this means the IRD shall not change back temporary subtitling setting based on EIT events for the service). |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs, all FE |

| | | |
|--|---|-------------|
| Test procedure | Purpose of test: To verify that the IRD supports temporary chaging of the subtitling settings. | |
| | Equipment: | |
| |  | |
| | Test signal configuration: A transport stream is used as a test signal. Within transport stream at least two services are carried with several subtitling components in several languages. At least in one of the services shall match with the subtitling language settings in IRD and the other service is not matching to any language settings. | |
| | Test procedure: <ol style="list-style-type: none"> 1. Tune IRD to a service that includes subtitling service that matches the IRD language settings. 2. Verify that the correct subtitling is selected 3. Change the temporary subtitling setting to anoter language 4. Verify that subtitling language is selected according the temporary settings. 5. Wait until EIT events for the service has changed, verify that the IRD still shows subtitles. 6. Tune IRD to a service that includes subtitling service that DO NOT match the IRD language settings. (*) 7. Verify that the NO subtitling is selected 8. Tune IRD to a service that includes subtitling service that matches the IRD language settings. (*) 9. Verify that the correct subtitling is selected 10. Switch the IRD off/on, verify that subtitle settings are the permanent settings (that temporary settings are lost). <p>* If temporary settings are lost when changing service, temporary settings must be set again</p> | |
| Expected results: The IRD supports temporary subtitling language settings. | | |

| Test Case | Task 8:5 Subtitling – DVB Subtitling and sSubtitling priority (TTML/DVB/EBU) |
| Section | NorDig Unified 7.1.5 and 7.3 |

| Requirement | <p>If more than one subtitle stream with the same language code is received, the NorDig IRD shall only display a single subtitle stream based on the priority shown in the table below.</p> <table><tr><th>Subtitle stream</th><th>IRD Subtitle priority (1=highest)</th></tr><tr><td>EBU Teletext subtitling</td><td>3</td></tr><tr><td>DVB Subtitles</td><td>2</td></tr><tr><td>TTML Subtitles (1)</td><td>1</td></tr><tr><td colspan="2">Note 1: Only mandatory for Nordig HEVC IRD</td></tr></table> <p>Table 2.3 Subtitle priority</p> <p>The NorDig IRD shall be capable of decoding, as a minimum, a subset of the DVB subtitle services as specified in section 7.3.2 and transmitted in conformance with ETS 300 743 [20], and displayed using the OSD capabilities whilst decoding the full television service (video and audio) to which it is associated.</p> <p>The NorDig IRD shall be able to display both ‘normal’ and ‘hard of hearing’ subtitles, according to user preference settings.</p> <p>Within DVB Subtitling it is possible to transmit common pages for all languages and subtitling streams inside one DVB subtitling PID, this is referred to as ‘ancillary pages’. Support for ancillary pages is optional for NorDig IRD. The enabling or disabling of the subtitle ancillary pages, if available, should be user controlled, with subtitle ancillary pages enabled as default option. The selection of subtitle ancillary pages shall be independent of the enabling of subtitle composition pages.</p> <p>The precision of the presentation of the subtitles shall be within 2 frames.</p> | Subtitle stream | IRD Subtitle priority (1=highest) | EBU Teletext subtitling | 3 | DVB Subtitles | 2 | TTML Subtitles (1) | 1 | Note 1: Only mandatory for Nordig HEVC IRD | |
|--|--|--------------------------------------|--------------------------------------|-------------------------|--------------|---------------|----------------|--------------------|---------------|--|-------------------|
| | Subtitle stream | IRD Subtitle priority (1=highest) | | | | | | | | | |
| | EBU Teletext subtitling | 3 | | | | | | | | | |
| | DVB Subtitles | 2 | | | | | | | | | |
| | TTML Subtitles (1) | 1 | | | | | | | | | |
| Note 1: Only mandatory for Nordig HEVC IRD | | | | | | | | | | | |
| IRD Profile(s) variants and capability | Basic, IRD, FE HEVC, all IRDs, all FE | | | | | | | | | | |
| Test procedure | <p>Purpose of test:</p> <p>To verify that priority among DVB subtitling streams is implemented, according to table above (i.e. TTML highest prio (if TTML is supported), then DVB Subtitling and last EBU Teletext subtitling. and that it has higher priority than Teletext subtitling.</p> <p>Equipment:</p> <table><tr><td>MPEG 2-source</td><td>DVB-S/C/T Modulator</td><td>Up Converter</td><td>DVB Receiver</td><td>Monitor</td></tr></table> <table><tr><td>MPEG TS Source</td><td>MPEG MUX</td><td>DVB modulator</td><td>NorDig IRD</td><td>Monitor (for STB)</td></tr></table> | MPEG 2-source | DVB-S/C/T Modulator | Up Converter | DVB Receiver | Monitor | MPEG TS Source | MPEG MUX | DVB modulator | NorDig IRD | Monitor (for STB) |
| | MPEG 2-source | DVB-S/C/T Modulator | Up Converter | DVB Receiver | Monitor | | | | | | |
| MPEG TS Source | MPEG MUX | DVB modulator | NorDig IRD | Monitor (for STB) | | | | | | | |

A transport stream containing a test service s according to table below with teletext subtitling and DVB subtitling components. All subtitling streams/PIDs shall have (at least) one 'translation dialogue' ('normal') subtitle language that matches the IRD's primary subtitling language setting (ie same language code shall be available in the descriptors for all subtitling streams/PIDs). The actual content inside the different subtitling streams/PIDs is recommended be different in order to easy detect which stream the IRD is displaying (e.g. different positioning or different colour or different subtitle content).

Ensure the NorDig IRD user preference settings at start up:

1. Subtitling primary language: lang1 (for example 'Swedish')
2. Subtitling primary language: lang2 (for example 'English')
3. translation dialogue/normal subtitling ON and
4. should have Hard-of-hearing subtitling OFF.

| Service | Containing following subtitling formats and the order in PMT |
|-------------------------------------|--|
| Service1 /mode 1 | 1. EBU Teletext subtitling (normal, lang 1) |
| Service2 /mode 2 | 1. EBU Teletext subtitling (normal, lang 1) 2. DVB Subtitling (normal, lang 1) |
| Service3 /mode 3 reversed PID order | 1. DVB Subtitling (normal, lang 1) 2. EBU Teletext subtitling (normal, lang 1) |
| Service4 /mode 4 (HEVC IRDs) | 1. EBU Teletext subtitling (normal, lang 1) 2. DVB Subtitling (normal, lang 1) 3. TTML Subtitling (normal, lang 1) |
| Service5 /mode 5 | 1. EBU Teletext subtitling (normal, lang 2) 2. DVB Subtitling (normal, lang 2) 3. TTML Subtitling (normal, lang 2) (HEVC IRD only) |
| Background service | 1. no subtitling |

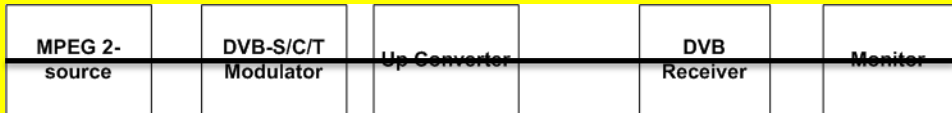

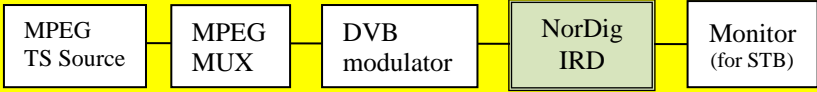

Note: Service 1-5 can either be via test stream contains all services or via that one test service is re-configured (e.g. via dropping/adding subtitling PIDs in the MPEG Mux) between the tests. In this case of only one test service, then test procedure instead of zapping to next test service, shall be via first zap IRD to background service, then change test service with the MPEG Mux and last zap IRD back to test service.

Test procedure:

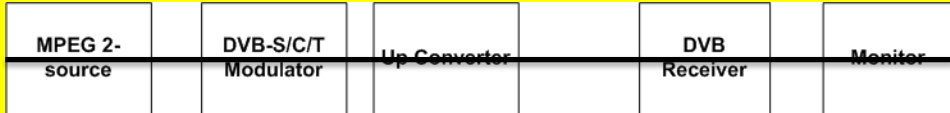

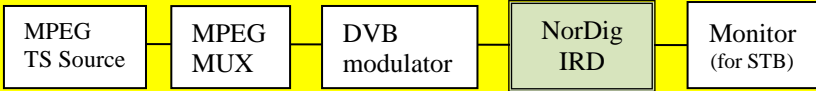

1. Drop the DVB subtitling component in the mux. Only Teletext subtitling is broadcasted. Start by scan to/select the background service containing no subtitling component (no subtitling displayed).
2. Zap through the five services (service modes).
3. Zap from, then to, the test service to make sure that the IRD has updated the PMT.
4. For each service/mode Verify that the IRD display correct/expected subtitling according to table below. Teletext subtitling is displayed. Fill in the test protocol.
5. Add the DVB Subtitling component in the mux. Both DVB and Teletext is now present.
6. Verify that the DVB subtitling is the only component that the IRD displays. Fill in the test protocol.

| | <div>7. Verify that the DVB subtitling is in synchronisation with the video for both SD and HD services for a longer period of time, eg. 45 minutes.. Fill in the test protocol.</div> <div>8. Enter the language set up and select a subtitling language that is not available as primary subtitling language, but as secondary subtitling language.</div> <div>9. Verify that the secondary DVB language is displayed, and in sync with the video.</div> <div>10. Access the menu system for subtitling preferences.</div> <div>11. Verify the “normal” DVB subtitling can be enabled and disabled. Verify the functionality. (In case of teletext subtitles are still broadcasted, the decoding of the teletext subtitles should start)</div> <div>Expected result: All test results are OK.</div> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 8:14 DVB Subtitling and DVB Subtitling subset |
| Section | NorDig Unified 7.3.2 |
| Requirement | <p>7.3.1 DVB Subtitling - General</p> <p>The NorDig IRD shall be capable of decoding, as a minimum, a subset of the DVB subtitle services as specified in section 7.3.2 and transmitted in conformance with ETSI EN 300 743, and displayed using the OSD capabilities whilst decoding the full television service (video and audio) to which it is associated.</p> <p>The NorDig IRD shall be able to display both ‘normal’ (‘translation dialogue’) and ‘hard-of-hearing’ subtitles, according to user preference settings.</p> <p>Within DVB Subtitling it is possible to transmit common pages for all languages and subtitling streams inside one DVB subtitling PID, this is referred to as ‘ancillary pages’. Support for ancillary pages is optional for NorDig IRD. The enabling or disabling of the subtitle ancillary pages, if available, should be user controlled, with subtitle ancillary pages enabled as default option. The selection of subtitle ancillary pages shall be independent of the enabling of subtitle composition pages.</p> <p>The precision of the presentation of the subtitles shall be within 2 frames.</p> <p>7.3.2 DVB Subtitling - Subtitling subset</p> |

| | |
|---|--|
| | <p>The NorDig IRD shall at least be capable of decoding the following DVB subtitling services:</p> <p>DDS: The Display Definition Segment for a subtitle service shall be supported for services that implement DDS, as defined in EN 300 743 [13]. Absence of a DDS implies that the display segment width shall be assumed as 720 pixels and the height as 576 lines.</p> <p>The NorDig IRD shall at least be capable of decoding the following DVB subtitling services:</p> <p>Object types: The handling of the object type (0x00) ‘basic object, bitmap’ shall be supported. The handling of the other object types (i.e. 0x01), ‘basic object, character’ and (0x02) ‘composite object, string of characters’) is optional.</p> <p>Regions: The number of regions shall be according to the ETSI 300 743 [22] specification, however a limitation in the display area due to memory restrictions is allowed. The total number of regions to handle shall be able to cover four complete subtitle rows (per frame) where one subtitle row shall be extendable to 1906 pixels * 60 pixels. The regions shall have the possibility to cover 457440 pixels per frame.</p> <p>Number of objects: The number of objects shall be at least 128.</p> <p>CLUT: The NorDig IRD receiver shall be able to handle at least one colour look-up table (CLUT) with a minimum of 16 entries per region and the possibility to have one colour scheme applied in each of the regions. It shall be possible to choose any 24-bit RGB colour into the 16 entries. The decoder shall be able to handle the mapping to the closest colour match if the decoder has some limitation in the colour presentation. The use of the non_modifying_colour flag is optional.</p> <p>Transparency: The NorDig IRD receiver shall implement at least 5 levels of transparency; 0% (opaque), 30%, 50%, 70% and 100% (completely transparent). Implementation of additional intermediate levels of transparency is optional. Where the NorDig IRD cannot complement a particular value of semitransparency it shall replace it with the nearest value of transparency it can implement. However, if the encoded value of transparency is in the range 10%-90% it shall not be approximated as either 0% or 100% transparency. So, 9% may be approximated as 0% but 10% shall be represented with a value in the range 10% to 90%, such as 30%. Similarly, 91% may be approximated as 100%.</p> <p>Number of streams: NorDig IRD shall support at least one DVB-subtitling streams i.e. at least support decoding of one subtitling composition page while support of one simultaneously available ancillary page is optional.</p> |
| IRD Profile(s) variants and capabilit | Basic, IRD, FE all IRDs, all FE |
| Test procedure | <p>Purpose of test: To check that the different DVB Subtitling services are functional.</p> |

Equipment:

Test signal configuration:

A transport stream with at least one SD and one HD service with DVB Subtitling is carried. DVB's Subtitling descriptor shall include references to as many different normal subtitle pages (ie translation dialogue) with different languages as that are tested (all subtitling pages should be to different subtitle streams inside the Subtitle PID, this in order to detect that the IRD opens appropriate page for that language, for example Swedish p1, Norwegian p2, Finish p3, English p5).

The DVB Subtitling stream(s) shall be according with NorDig defined subset and should be made to test subset (only bitmap mode, DDS, object types, regions, CLUT, transparency) and should be made easy to verify synchronisation between subtitling and video (for example video containing burn-in time code and subtitles content informing when relative video time code subtitles to be displayed and when they shall be removed). For one HD service the subtitling should be made with SD resolution with DDS, to test IRD scaling up and position SD subtitling to HD video raster out). For another HD service (or test setup) the subtitling should be made with HD resolution, to test IRD handle HD subtitling to HD video raster out).

Test procedure:

Start condition: IRD installed on the network

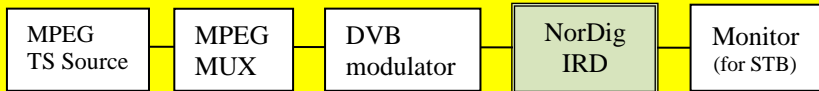

Subtitle language tests

1. Zap to a service with multiple subtitle languages. Select in the IRD's settings an available language as primary language and check that the subtitling is displayed.
2. Verify that the IRD selects and displays the correct subtitling page/language that matches the IRD's current primary subtitling language setting. (Correct/expected subtitling page shall be according to the signaling inside the Subtitling descriptor). Verify that the subtitle is in sync with the video for both SD and HD services for a medium long period of time, eg. 45 minutes.
3. Fill in the results in the protocol (test point 1-3).
4. Enter the IRD settings for language set up and select a primary subtitling language that is not available in test services and select secondary subtitling language that is available in the test services.
5. Verify that the IRD now selects and displays the correct subtitling page/language that matches the IRD's current secondary subtitling language setting and in sync with the video.
6. Fill in the results in the protocol.

Repeat 1-3 for the other subtitling languages (minimum two languages) and fill in the protocol.

7. DVB Subtitling subset: DDS, object types, regions, CLUT, transparency (can be combined with test step 3, enough to test for one language). Verify that positioning the subtitling reasonable correct at video output, upscaling of

| | <p>subtitling is handled, handling of colours and reasonable expected for transparency.</p> <p>8. Fill in the results in the protocol (test point 9).</p> <p>9. Long time stability test several hours for one service and one IRD setting. Set/ensure IRD primary subtitling language to match one language of the test service. Let the IRD runs for several hours (preferable more than 5hours), verify that the IRD still decodes and displays subtitling as expected and that subtitles still is in sync with video. (The long time stability test shall be made at least one time for either TTML, DVB Subtitling or EBU Teletext subtitling).</p> <p>10. Fill in the results in the protocol (test point 10).</p> <p>Expected result: Subtitling is displayed as defined in requirements.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|---|--|
| Test Case | Task 9:10 HDMI – Signal protection for STBs (HDMI output) |
| Section | NorDig Unified 8.6.4 |
| Requirement | <p>HDMI interfaces that can output content that is originated from a DVB input signal shall support the High bandwidth Digital Content Protection (HDCP) [39].</p> <p>The NorDig IRD's HDMI interface (output or input) used to transport audio & video content shall support the High-bandwidth Digital Content Protection (HDCP) rev. 1.4 or higher.</p> <p>The NorDig HEVC IRD's HDMI interface (output or input) used to transport audio & video content shall support High-bandwidth Digital Content Protection (HDCP) rev. 2.2 or higher.</p> <p>NorDig HEVC STB shall only fall back to HDCP rev. 1.4 when connected to an HDMI sink that doesn't support HDCP rev. 2.2 or higher.</p> <p>The Broadcast received services may be flagged with a need for content protection or not (CP "ON" or "OFF") via either the PMT-table or the CA-system or or both similar, as specified by the relevant network/CA-operator.</p> <p>Signals that the IRD is entitled to receive shall be sent to the HDMI-sink (display) in accordance with the following conditions:</p> <ol style="list-style-type: none"> In case the received service is flagged with <u>no need</u> for content protection, the signal may be sent to the sink with HDCP disabled (1). In case the received service is flagged with content protection <u>required</u> via the CA-system, the signal shall only be sent to the sink with the HDCP enabled, i.e. when the HDMI sink satisfies the HDCP requirements <u>and</u> HDCP protection is established on the HDMI-link. <p>The IRD should (2) provide an option for setting the preferred HDCP-state, ("HDCP-user setting"), that can be set between following modes: to either</p> <ul style="list-style-type: none"> ON (where ON refers to 'always on') and or OFF and/or AUTO mode, (where OFF refers to 'always off' and AUTO refers to 'automatic; on when required and off when not required'). <p>The HDCP-user setting shall apply to all services receivable by the IRD. Changes to this setting shall survive channel change, standby and power on/off.</p> <p>Note 1: Disabling of HDCP is optional</p> <p>Note 2: This option – when available- shall be available via the IRD's menu system, unless otherwise specified by the relevant network/CA-operator.</p> <p>NorDig Unified 16.4, Factory default value for the HDCP user preference setting (if supported) shall be 'ON or as specified by the relevant network/CA operator'.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE HEVC STB, all STB |
| Test procedure | <p>Purpose of test:</p> <p>For IRDs with HDMI output(s) (typically a STB), verify that the NorDig IRD receiver is able set the status HDCP according the signal protection scheme.</p> <p>This test is mandatory if the IRD has HDMI output interface.</p> <p>Equipment:</p> |

Setup for STB/HEVC STB test

HDMI Tester, refers to test instrument or equal system that can verify HDMI and HDCP (version etc).

Test procedure:

1. Setup the equipment
2. Check if IRD has HDCP user preference settings and if supported then check that it is default 'ON', fill in test result (this test may be tested when testing IRD's all user preference setting).
3. Basic (non-HEVC) STB, connect a signal with a service that requires content protection, verify that HDCP is active and service content is presented on the HDMI output and check HDCP rev. 1.4 or higher with a HDMI tester, fill in test result.
4. HEVC STB, connect a signal with a service that requires content protection (rev 1.4 or rev 2.2), HDMI sink (TV monitor/HDMI tester) must support HDCP rev 2.2, verify that HDCP is active and service content is presented on the HDMI output and check HDCP rev. 2.2 or higher with a HDMI tester, fill in test result.
5. HEVC STB, connect a signal with a service that requires content protection rev 1.4 (content that demands HDCP rev 1.4), change to a HDMI sink (TV monitor/HDMI tester) that only supports HDCP rev 1.4, verify that HDCP is active and service content is presented on the HDMI output and check HDCP rev. is 1.4 with a HDMI tester, fill in test result.
6. STB/HEVC STB, connect a signal with a service that requires content protection rev 1.4 (content that demands HDCP rev 1.4), change to a HDMI sink (TV monitor/HDMI tester) that does not support HDCP rev 1.4 or higher, verify that service content is **not** be presented on the HDMI output, instead STB should display an error message.
7. HEVC STB, connect a signal with a service that requires content protection rev 2.2 (content that demands HDCP rev 2.2), change to a HDMI sink (TV monitor/HDMI tester) that only supports HDCP rev 1.4, verify that service content is **not** be presented on the HDMI output, instead STB should display an error message.
8. If STB/HEVC STB has HDCP user preference settings and if supported then change settings to 'OFF' or 'AUTO' (steps 10 to 13), fill in test result (that it was possible to change mode).
9. STB/HEVC STB, connect a signal with a service that requires content protection, verify:
 - if IRD has a HDCP mode 'OFF' then HDCP shall be inactive and service content shall not be presented on the HDMI output, instead STB shall display a message. Change HDCP setting to 'ON' and verify that HDCP now is active and service content is presented on the HDMI output, fill in test result (change back HDCP setting to 'OFF' before next step)
 - if IRD has a HDCP mode 'AUTO' then HDCP shall be active and service content is presented on the HDMI output, fill in test result.
10. STB/HEVC STB, connect a signal with a service that does not require content protection, verify HDCP is inactive/disabled and service content is presented in the clear on the HDMI output, fill in test result.

11. For STB/HEVC STB which has a HDCP 'AUTO', connect a signal which includes both a service that require CP and another service that do not require CP, zap between the services a couple of times, verify between each zap that HDCP is active for CP service/inactive for non-CP service and service content is presented on the HDMI output, verify zapping time until service is present is not too long (e.g. not more than 15-20sec), fill in test result.
2. Set the content protection mode to one by one each mode in table below
3. Fill in test results

Expected result:

- (step 2) If IRD has HDCP setting, then factory default setting shall be 'ON' (always ON), unless otherwise specified by relevant network/CA operator.
- (step 3) STB and iDTV shall support HDCP rev. 1.4 or higher.
- (step 4 and step 6) HEVC STB and iDTV shall support HDCP rev. 2.2 or higher.
- (step 5) HEVC STB shall be able fall back to HDCP rev. 1.4 when connected to an HDMI sink (TV monitor) that doesn't support HDCP rev. 2.2 or higher.
- (Step 2 to 7) For content/services that is signalized to that content protection is required, NorDig IRD/STB shall have HDCP active on HDMI output to the HDMI sink (TV monitor). If HDMI sink (TV monitor) do not support required HDCP rev. then the NorDig IRD/STB shall not output selected service and instead output "black" and preferably an error message for the viewer.
- (step 8 to 11) If the NorDig IRD/STB supports HDCP user setting 'OFF', for content/services that is signalized to that content protection is required, then NorDig IRD/STB shall **not** be present service content on the HDMI output, instead STB shall display a message that inform the end user that the HDCP user setting must be turned ON in order to view protected content.
- (step 8 to 11) If the NorDig IRD/STB supports HDCP user setting 'AUTO', for content/services that is signalized to that content protection is required, then NorDig IRD/STB shall **not** be present service content on the HDMI output without HDCP active.
- It shall be possible to set the content protection mode (HDCP e.g. ON/OFF/AUTO).

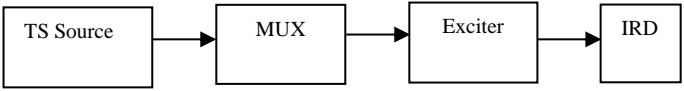

Test result(s)

| step | IRD type | Service CP signalling (1) | STB's HDCP setting (2) | Description (STB/iDTV actions) | NOK or OK or n/a |
|------|----------------------|---------------------------|------------------------|---|------------------|
| 2 | All IRDs | | ON / always on | | |
| 3 | (non-HEVC) Basic STB | CP Required | ON / always on | HDCP active and service content is presented on the HDMI output. HDCP rev. 1.4 or higher. | |
| 4 | HEVC STB | CP Required | ON / always on | HDCP active and service content is presented on the HDMI output. HDCP rev. 2.2 or higher. | |
| 5 | HEVC STB | CP Required rev 1.4 | ON / always on | HDCP active and service content is presented on the HDMI output. HDCP rev. 1.4. | |

| | | | | | | | |
|---------------------|---|---|--|---------------------------|---|--|--|
| | 6 | All STBs | CP Required rev 1.4 | ON / always on | HDCP inactive and service content is not be presented on the HDMI ouput, instead STB should display a error message. | | |
| | 7 | HEVC STB | CP Required rev 2.2 | ON / always on | TV service content is not be presented on the HDMI ouput, instead STB should display a error message. HDCP may be active (rev 1.4) or not during the display of the message. | | |
| | 8 | All STBs- | - | ON/OFF/ AUTO | If STB do not have HDCP setting then result 'not applicable' (n/a). If STB has HDCP setting, result if possible to set 'ON', 'OFF' and/or 'AUTO' then 'OK', if not possible to change setting then NOK. | | |
| | 9a | All STB w HDCP setting 'OFF' | CP Required | OFF | HDCP inactive and service content shall not be presented, instead display a message. | | |
| | 9b | All STB w HDCP setting 'AUTO' | CP Required | AUTO | HDCP active and service content is presented on display. | | |
| | 10a | All STB w HDCP setting 'OFF' | CP not required | OFF | HDCP is inactive/disabled and service content is presented in the clear on the HDMI ouput | | |
| | 10b | All STB w HDCP setting 'AUTO' | CP not required | AUTO | HDCP is inactive/disabled and service content is presented in the clear on the HDMI ouput | | |
| | 11 | All STB w HDCP setting, 'AUTO'. | Two or more services, one with CP and one without CP | AUTO | HDCP active for service require CP and HDCP inactive for service that do not require CP', resonable time for zapping. | | |
| | Note 1. Signalled Content Protection level incoming service, CA-system | | | | | | |
| | Note 2. STB's HDCP user preference setting, if supported (optional feature) | | | | | | |
| n/a: not applicable | | | | | | | |
| | | | | | | | |
| | Mode | IRD actions | CA system | PMT table | NOK or OK | | |
| | 1 | HDCP may be disabled for this service regardless of HDCP user setting (Return to HDCP user setting when leaving this service) Note: This requirement is optional | HDCP Not wanted | 0x00 (HDCP Not wanted) | | | |
| | 2 | HDCP shall be enabled for viewing this service | HDCP Wanted | 0x00 (HDCP Not wanted) | | | |

| | | | | | |
|-------------------|---|---|------------------|-----------------------------------|--|
| | | (Return to HDCP user setting when leaving this service) | | | |
| | 3 | Content protection is not required. HDCP may be enabled or disabled. | CP Not-needed | 0x01 (Not-needed) | |
| | 4 | Content protection is required. HDCP shall be enabled for viewing this service | CP Required | 0x01 (Not-needed) | |
| | 5 | SD service: HDCP may be enabled or disabled HD service: HDCP shall be enabled this service | CP Not-needed | 0x02 (conditional requirement) | |
| | 6 | Content protection is required. HDCP shall be enabled for viewing this service | CP Required | 0x02 (conditional requirement) | |
| | 7 | Content protection is required. HDCP shall be enabled for viewing this service | CP Not-needed | 0x03 (CP required) | |
| | 8 | Content protection is required. HDCP shall be enabled for viewing this service | CP Required | 0x03 (CP required) | |

2.11 Task 11: The System Software Update

2.11.1 SSU testing General

The NorDig IRD shall provide a software download mechanism that enables download of system software to replace existing software.

Delivery alternatives (optional or mandatory depending on the connectable status of the IRD) are:

- [OTA](#) (#D1 and #D2): "Over-the-Air", refers here to over the broadcast channel (via terrestrial, cable, satellite or managed IPTV interface).
- [OTA Notification](#) (#D3): refers here to search/get notification over the broadcast channel and download from Internet and/or USB.
- [OTN](#) (#D4): "Over-the-Network", refers here to over the Internet channel (via IRD's two-way interface).
- [USB](#) (#D5): "Local", refers to download from the local interface.

During the SSU testing both upgrade and downgrade are performed with a special mode/SW used for the downgrade process (normally not available with production software/public SSU).

Alternatively the manufacturer must deliver several physical samples that can each be upgraded once.

2.11.2 Test equipment summary

To configure the minimum test setup described in these test procedures, the test setup seen in Figure 3 can be used.

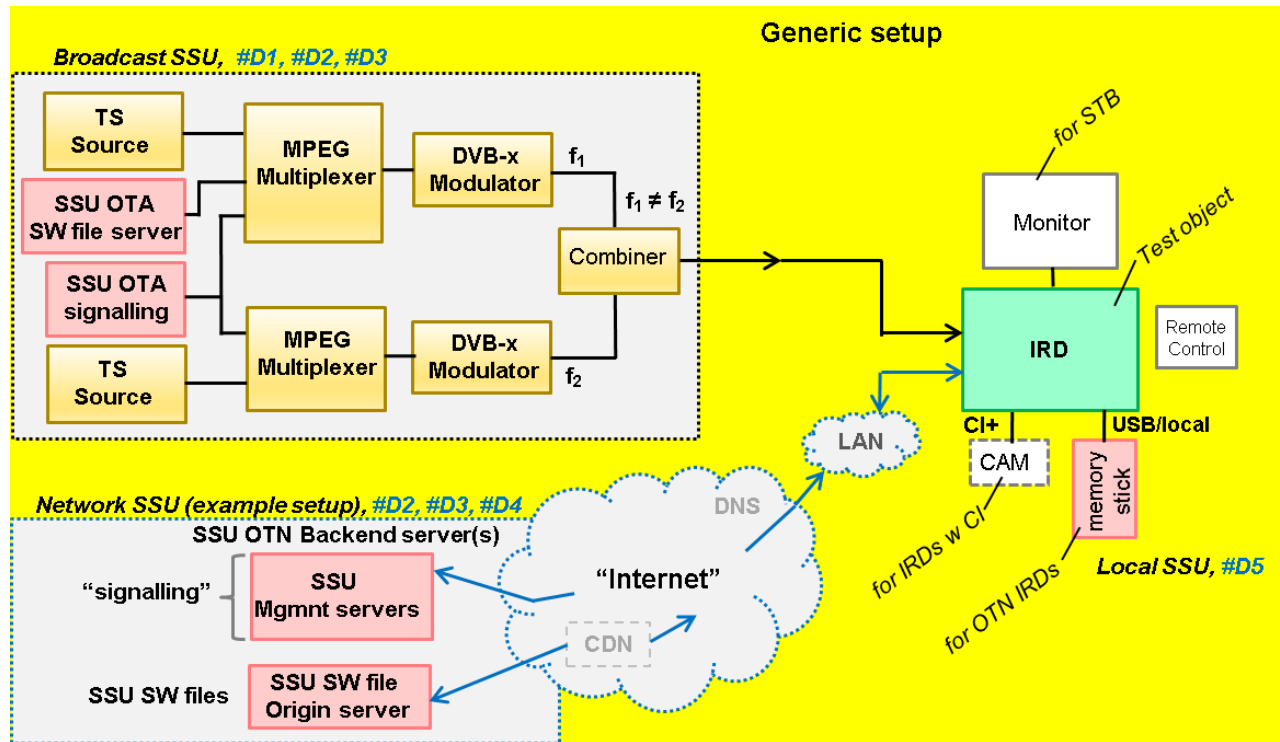

Figure 3. Generic test setup for SSU / CI+ CAM test procedures

Note! The equipment needed may vary depending on the system used and can be purchased from many vendors even in a compact all-in-one unit. However, most of the tests can be done using one general test setup.

2.11.2.1 Broadcast SSU (OTA)

The OTA-SSU / CI+ CAM update service is carried within a transport stream. The TS must contain the correct type of signaling information in order for the IRD to detect the correct OTA-SSU / CI+ CAM update service. The following sections describe minimum signaling information.

The NIT must contain:

- Linkage_descriptor 0x4A to DVB SSU service using linkage_type 0x09.

Example for linkage_descriptor for IRD system download located at TSID/ONID 0x0456/0x22F1.

| | |
|-----------------------|--------|
| Descriptor_tag | 0x4A |
| Transport_stream_id | 0x0456 |
| Original_network_id | 0x22F1 |
| Service_id | 0x1194 |
| Linkage_type | 0x09 |
| OUI *) | |
| selector_bytes | |
| private_data_byte **) | |

*) DVB OUI or manufacturer specific OUI

) The private_data_byte **shall be used as specified in the DVB Data Download Specification; Part 1: Simple Profile. (ETSI TS 102 006 v1.3.1)

The PMT must contain:

(The descriptor **shall** be placed in the component loop of the PSI PMT table.)

- Data_broadcast_id_descriptor

| | |
|------------------------|--------|
| descriptor_tag | 0x66 |
| data_broadcast_id | 0x000A |
| id_sector_bytes *) | |
| OUI **) | |
| update_type ***) | |
| update_versioning_flag | |
| update_version | |
| selector_bytes | |
| private_data_bytes | |

*) The id_sector_bytes **shall** be used as specified in the DVB Data Download Specification (ETSI TS 102 006).

) The OUI value in the PMT **shall match the OUI value in the NIT linkage to SSU descriptor.

***) Update_type, use value below specified for simple or enhanced profiles;

| | |
|--|------------|
| proprietary update solution (not allowed). | 0x0 |
| standard update carousel (i.e. without notification table) via broadcast. | 0x1 |
| system software update carousel with notification table (UNT) both available via broadcast. | 0x2 |
| system software update signaled via broadcast UNT, update available from the return channel. | 0x03 |
| system software update signaled via broadcast UNT, update available from the Internet. | 0x04 |
| Reserved for future use. | 0x5 – 0xFF |

The UNT must contain:

Signaling of UNT is relevant in case of the data_broadcast_id_descriptor parameter update_type is set to 0x02 in PMT.

The parameters for different descriptors in UNT are specified below:

| | |
|---|------|
| descriptor_tag | 0x4B |
| table_id | 0x01 |
| OUI ¹⁾ | |
| processing_order ²⁾ | |
| common_descriptor_loop ³⁾ | |
| target_descriptor_loop ⁴⁾ | |
| operational_descriptor_loop ⁵⁾ | |

1) The OUI value in the PMT **shall** match the OUI value in the NIT linkage to SSU descriptor.

2) Depending on the SSU OTA mechanism.

3) common_descriptor_loop carries information which is intended for descriptors which apply to all platform/target devices listed in target_descriptor_loop and operational_descriptor_loop.

4) target_descriptor_loop can contain descriptor:

- target_serial_number_descriptor

5) operational_descriptor_loop can contain descriptors:

- **scheduling_descriptor**

Examples for scheduling_descriptor

| | |
|---------------------------|------|
| descriptor_tag | 0x01 |
| start_date_time | |
| end_date_time | |
| final_availability | 0 |
| periodicity_flag | |
| period_unit | |
| duration_unit | |
| estimated_cycle_time_unit | |
| period | |
| duration | |
| estimated_cycle_time | |

- **update_descriptor**
- **ssu_location_descriptor**
- **message_descriptor**
- **ssu_subgroup_association_descriptor**
- **private_data_specifier_descriptor**

See more details regarding settings in DVB Data Download Specification (ETSI TS 102 006).

NorDig T2-IRD SSU OTA in DVB-T2 system

- The SSU stream is broadcast with parameter settings of PLP_ID = 1, T2_System_Id = 1 and Cell_Id = 1 in a single PLP mode.

2.11.2.2 Network SSU

The IRD manufacturer must ensure that the published OTN software contains the correct type of signaling information in order for the IRD to detect the correct SSU.

The IRD manufacturer **shall** ensure a software upgrade is available over the public Internet, the test is not valid if the SSU is just locally published in a lab environment.

For the OTN testing the IRD must connect to the Internet by LAN cable or via Wi-Fi through a local router or access point.

The Internet connection during testing should reflect the country settings of the IRD under test, e.g. using a VPN tunnel to simulate ip connection from the same country as the country setting of the IRD.

2.11.3 Test cases

| | |
|--------------------|---|
| Test Case | Task 11:1 IRD System software update using DVB SSU simple profile |
| Section | NorDig Unified 10.1, 10.2,10.5, 12.2.6 and 16.4 |
| Requirement | <p>The NorDig IRD shall provide a software download mechanism that enables download of system software, to add a new system software or replace an existing system software.</p> <p>The upgrade of NorDig IRD software shall be initiated by the user (by update user preference setting and/or by user interaction). The user shall be able to choose the update approach for the IRD (see 10.2.1 in IRD spec) and the user shall be able to disable any automatic update. The factory default shall be a value that disables Fully Automatic mode.</p> |

| | |
|--|--|
| | <p>In cases where the user is prompted to confirm an update, the user shall be able to confirm or to abort/postpone the update (for example with a Yes and No option). If the user selects to abort/postpone an available update or by other ways cancel an available update, the NorDig IRD shall remind the user as stated in section 10.1.6 in IRD spec.</p> <p>The NorDig IRD shall be provided with a mechanism ensuring that only newer software versions than the existing System Software are accepted.</p> <p>If the NorDig IRD System software is corrupt (due to normal operation of the IRD or due to updating the system software), the IRD manufacturer shall provide a backup mechanism, either on local storage or via download, which can make the IRD operational again.</p> <p>The NorDig IRD supporting SSU via broadcast channel shall support the DVB SSU simple profile using the signalling in NIT, BAT and PMT, in accordance with the DVB-SSU specification . The Linkage descriptor in the NIT table, for linking to the SSU service is defined in NorDig Unified IRD specification section 12.2.6.</p> |
| IRD Profile(s) variants and capability | all IRDs using OTA SSU simple profile |
| Test procedure | <p>Purpose of test: To verify the IRD system software update process in broadcast channel using DVB SSU simple profile.</p> <p>The SSU end user functionality is not tested in this case. It is tested in Task 11:6 SSU end user functionality.</p> <p>This test is convenient to do parallel with Task 11:6 SSU end user functionality.</p> <p>Equipment: Test setup described in 2.11.2 Test equipment summary</p> <p>For the testing three IRD SSU software is needed, “SW v1“, “SW v2“ and “SW v3“, (“SW v1“ as starting point, “SW v2“ for testing upgrading and “SW v3“ for testing “non-downgrading”).</p> <p>IRD manufacturer shall ensure that software upgrade (“SW v1”) , (“SW v2”) and (“SW v3”) is available for the test lab.</p> <p>Two approaches for the SSU testing, either via using: - one single IRD with possibility to upgrade and downgrade the SW by other means plus SSU sw images of “SW v1“ , “SW v2“ and “SW v3“. - alternative via using multiple IRDs. Two IRDs with software “SW v1“ and one IRD with software “SW v3“.</p> <p>Selection of two different ONID for different networks corresponding country1 and country2 in the test procedure.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other. 2. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. The system software PID, PMT PID |

- and SID may not conflict with each other. (Simulates three system software streams.)
3. Configure linkage_descriptor for the two system software download streams not to be suitable for the IRD under test. The linkage_descriptor parameters for the third download stream **shall** be suitable for the IRD under test. The third system software download stream **shall** be the last in order.
 4. Fill in the test results which parameters are unmatching with the IRD under test.
 5. For the frequency f2 configure linkage_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).
 6. Make sure the IRD has "SW v1" installed.
 7. Perform factory reset to the IRD, complete the "first time" installation and check that all the services are possible to receive.
 8. Tune the IRD to a service on the frequency f1.
 9. Fill in the test results if the IRD has a setting for automatic search and it is set to "auto search".
 10. Initiate the download.
 11. Verify that the software in the IRD is updated to "SW v2".
 12. Fill in the test protocol.
 13. Downgrade IRD software to "SW v1".
 14. Tune the IRD to a service on the frequency f2.
 15. Initiate the download again.
 16. Verify that the software in the IRD is updated to "SW v2".
 17. Fill in the test protocol.
 18. Upgrade IRD software to "SW v3".
 19. Perform factory reset to IRD and check that all the services are possible to receive.
 20. Initiate the download again. Verify that no software update occurs.
 21. Downgrade IRD software to "SW v1".
 22. Initiate the download again.
 23. During the update process (step 10), remove the power cable to corrupt the installation of the system software to corrupt the downloading of the system software.
 24. Wait 10 seconds and then re-insert the power cable.
 25. Verify that the IRD is still usable.
 26. Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc.
 27. Initiate the download again.
 28. Plug out the antenna cable. (Simulates RF disturbances).
 29. Plug in the antenna cable.
Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc.
 30. Verify which ONID values correspond country1 and country2 settings in IRD.
 31. Make sure that the IRDs country setting is equal to country2.
 32. Configure the TS from f1 carrying the SSU service so that the ONID is equal to country1.
 33. Configure the TS from f2 so that the ONID is equal to country2.
 34. Fill in the test protocol which ONID values are broadcasted in TS in f1 (country1) and f2 (country2).
 35. Fill in the test protocol which country settings are selected in the IRD.

| | 36. Control that the IRD will not download and install the SSU. 37. Fill in the test protocol. Expected result: IRD performs a software update from DVB SSU simple profile OTA broadcast available stream. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 11:2 IRD System software update using DVB SSU enhanced profile - scheduling |
| Section | NorDig Unified 10.1, 10.2 and 10.5 |
| Requirement | The NorDig IRD supporting SSU via broadcast channel shall provide a software download mechanism in accordance with the DVB SSU specification , the IRD shall support the SSU Simple Profile and the parts of SSU Enhanced Profile that are specified below. |

| | |
|--|---|
| | <p>The test requirements are the same as for DVB SSU simple profile in Task 11:1 with the addition of scheduled tasks.</p> <p>The NorDig IRD supporting SSU download via broadcast channel shall support the DVB SSU UNT Enhanced profile using the signalling in NIT, BAT, PMT, and UNT, in accordance with the DVB-SSU specification. The Linkage descriptor in the NIT table, for linking to the SSU service is defined in section 12.2.6. The descriptors of the UNT Enhanced profile are specified in Section 12.7.</p> |
| IRD Profile(s) variants and capability | all IRDs using OTA SSU enhanced profile |
| Test procedure | <p>Purpose of test: To verify the IRD system software update process in broadcast channel using DVB SSU enhanced profile.</p> <p>The SSU end user functionality is not tested in this case. It is tested in Task 11:6 SSU end user functionality.</p> <p>This test is convenient to do parallel with Task 11:6 SSU end user functionality.</p> <p>Equipment: Test setup described in 2.11.2 Test equipment summary</p> <p>For the testing three IRD SSU software is needed, “SW v1“, “SW v2“ and “SW v3“, (“SW v1“ as starting point, “SW v2“ for testing upgrading and “SW v3“ for testing “non-downgrading”).</p> <p>IRD manufacturer shall ensure that software upgrade (“SW v1”), (“SW v2”) and (“SW v3”) is available for the test lab.</p> <p>Two approaches for the SSU testing, either via using: - one single IRD with possibility to upgrade and downgrade the SW by other means plus SSU sw images of “SW v1“, “SW v2“ and “SW v3“. - alternative via using multiple IRDs. Two IRDs with software “SW v1“ and one IRD with software “SW v3“.</p> <p>Selection of two different ONID for different networks corresponding country1 and country2 in the test procedure.</p> <p>Test procedure: Refer to Task 11:1 but use DVB SSU enhanced download stream instead.</p> <ol style="list-style-type: none"> 1. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other. 2. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. (Simulates three system software streams.) 3. Configure linkage_descriptor for the two system software download streams not to be suitable for the IRD under test. The linkage_descriptor parameters for the third download stream shall be suitable for the IRD under test. The third system software download stream shall be the last in order. 4. Fill in the test results which parameters are unmatching with the IRD under test. 5. Configure UNT inclusive scheduling_descriptor by creating schedule with three scheduling descriptors, one in the past and two in the future for the system download streams. |

6. For the frequency f2 configure linkage_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).
7. Make sure the IRD has "SW v1" installed.
8. Perform factory reset to the IRD, complete the "first time" and check that all the services are possible to receive.
9. Fill in the test protocol if the IRD support automatic search and it is set to "automatic search" by default.
10. Tune the IRD to a Tv service on f1, turn off the IRD and wait until IRD is standby.
11. Turn on the IRD from standby.
12. A message **shall** be displayed telling that a new software is available at the time specified in the scheduling_descriptor. The IRD **shall** find the nearest available scheduled time.
13. Verify that the "EXIT or abort" option works by verifying that no download occur at the scheduled time.
14. Turn off the IRD and wait until IRD is standby.
15. Turn on the IRD from standby.
16. Verify that the "Yes or OK" option works by verifying that download occur at the scheduled time.
17. Verify that the software in the IRD is updated to "SW v2".
18. Downgrade IRD software to "SW v1".
19. Perform 11,12,13,14,15,16,17,18 but Tune the IRD to a Tv service on f2, turn off the IRD and wait until IRD is standby.
20. Upgrade IRD software to "SW v3" or use "IRD".
21. Perform factory reset to the "IRD" and check that all the services are possible to receive.
22. Initiate the download again. Verify that no software update occurs.
23. Enhanced profile with software for the IRD under test, scheduled active now, with more than one schedule_descriptor in UNT.
24. Initiate a manual download from the menu.
25. A message **shall** be displayed telling that a new software is available right now.
26. Verify that both OK and EXIT works.
27. Reset the IRD
28. Perform 23,24,25,26 but initiate the download via a background/standby search.
29. Downgrade IRD software to "SW v1".
30. Verify which ONID values correspond country1 and country2 settings in IRD.
31. Make sure that the IRDs country setting is equal to country2.
32. Configure the TS from f1 carrying the SSU service so that the ONID is equal to country1.
33. Configure the TS from f2 so that the ONID is equal to country2.
34. Fill in the test protocol which ONID values are broadcasted in TS in f1 (country1) and f2 (country2).
35. Fill in the test protocol which country settings are selected in the IRD.
36. Initiate a download.
37. Control that the IRD will not download and install the SSU.
38. Downgrade IRD software to "SW v1".
39. Initiate the download again.

| Test Case | Task 11:3 IRD System software update using DVB SSU Notification |
| Section | NorDig Unified 10.1, 10.2, 10.3, 10.5 and 12.7 |
| Requirement | <p>For this approach the NorDig IRD shall automatically perform a regular search for a notification signal (using DVB SSU's Update_type 0x4) indicating the availability of new system software and, whenever new software is available, prompt the user with the IRD manufacturer's message associated with that</p> <p>The NorDig IRD shall support the SSU notifications update type 0x4 using UNT in accordance with the DVB-SSU specification. Linkage descriptor in the NIT table, for linking to the SSU service is defined in section 12.2.6 . The descriptors of the SSU UNT shall be as specified in Section 12.7 .</p> |
| IRD Profile(s) variants and capability | all IRDs using DVB SSU Notification profile |
| Test procedure | <p>Purpose of test: To verify the IRD system software update process in broadcast channel using DVB SSU Notifications. A typical use case for SSU Notification is to reach all non-connected connectable IRDs via broadcast channel with information that new SSU software is available but the new SSU software size is too large to be distributed via broadcast channel and/or requires a higher bandwidth over broadcast channel than is available. Manufacturers are recommended to:</p> <ul style="list-style-type: none"> - Pre-store SSU messages in their IRDs and messages should be in all available languages that the IRD supports, - Mainly using the message_index (in the enhanced_message_descriptor, see 12.7.10) to reference which pre-stored message to be displayed for the user, - Minimize the broadcast text (in the enhanced_message_descriptor and/or message descriptor, see 12.7.10). <p>Equipment: Test setup described in 2.11.2 Test equipment summary</p> |

Software/configuration information to enable the SSU Notification process in the IRD.

Test procedure:

1. Configure three outgoing download streams from the system software source. The system software PID, PMT PID and SID may not conflict with each other.
2. Configure the multiplexer to transmit three outgoing system software download streams within TS on the frequency f1. The system software PID, PMT PID and SID may not conflict with each other. (Simulates three system software streams.)
3. Configure linkage_descriptor for the two system software download streams not to be suitable for the IRD under test. The linkage_descriptor parameters for the third download stream **shall** be suitable for the IRD under test. The third system software download stream **shall** be the last in order.
4. For the frequency f2 configure linkage_descriptor to refer to the frequency f1 with suitable parameters for the over-the-air download. (Simulates frequency change).
5. Tune the IRD to a service on the frequency f1.
6. Perform a manual software update search.
7. Verify that a notification is presented
8. Reset the IRD to its factory default settings.
9. Repeat step 1-5.
10. Perform an automatic search from standby.
11. Turn on the IRD from standby.
12. Verify that a notification is presented
13. Reset the IRD to its factory default settings.
14. Tune the IRD to a service on the frequency f2.
15. Perform a manual software update search.
16. Verify that a notification is presented
17. Reset the IRD to its factory default settings.
18. Repeat step 1-5.
19. Perform an automatic search from standby.
20. Turn on the IRD from standby.
21. Verify that a notification is presented
22. Fill in the test results.

Expected result:

The IRD performs an SSU Notification update.

Test result(s)

| Unmatched SSU stream number | Unmatched parameter name |
|-----------------------------------|--------------------------|
| #1 | |
| #2 | |
| | |
| | ONID value |
| ONID value in TS in f1 (country1) | |
| ONID value in TS in f2 (country2) | |

| Test Case | Task 11:4 IRD System software update using over-the-network download |
| Section | NorDig Unified 10.1, 10.2 and 10.3 |
| Requirement | <p>The NorDig IRD shall provide a software download mechanism that enables download of system software, to add a new system software or replace an existing system software.</p> <p>The upgrade of NorDig IRD software shall be initiated by the user (by update user preference setting and/or by user interaction). The user shall be able to choose the update approach for the IRD (see 10.2.1) and the user shall be able to disable any automatic update. The factory default shall be a value that disables Fully Automatic mode.</p> <p>In cases where the user is prompted to confirm an update, the user shall be able to confirm or to abort/postpone the update (for example with a Yes and No option). If the user selects to abort/postpone an available update or by other ways cancel an available update, the NorDig IRD shall remind the user as stated in section 10.1.6 in IRD spec.</p> <p>The NorDig IRD shall be provided with a mechanism ensuring that only newer software versions than the existing System Software are accepted. A connected IRD receiving updates in this way shall still arbitrate between software versions available via the broadcast network and the IP-based broadband network to ensure that only newer versions are downloaded and installed (according with section 10.1.4.2 of IRD spec).</p> <p>If the NorDig IRD System software is corrupt (due to normal operation of the IRD or due to updating the system software), the IRD manufacturer shall provide a backup</p> |

| | |
|--|--|
| | <p>mechanism, either on local storage or via download, which can make the IRD operational again.</p> <p>The NorDig IRD shall be implemented with a protection mechanism for the existing system software. It shall ensure that the existing software will not be corrupted in case the System Software Update (SSU) is interrupted before the new system software is fully downloaded.</p> |
| IRD Profile(s) variants and capability | All IRDs using OTN SSU profile |
| Test procedure | <p>Purpose of test: To verify the IRD system software update process using over-the-network (OTN) download profile.</p> <p>The SSU end user functionality is not tested in this case. It is tested in Task 11:6 SSU end user functionality.</p> <p>Equipment: Test setup described in 2.11.2 Test equipment summary</p> <p>For the testing three IRD SSU software is needed, “SW v1“, “SW v2“ and “SW v3“, (“SW v1“ as starting point, “SW v2“ for testing upgrading and “SW v3“ for testing “non-downgrading”).</p> <p>IRD manufacturer shall ensure a software upgrade (“SW v2”) is available at the internet.</p> <p>Internet connection which can be enabled / disabled during the test (e.g. LAN connection through a local switch or Wi-Fi through a local access point)</p> <p>Two approaches for the SSU testing, either via using: - one single IRD with possibility to upgrade and downgrade the SW by other means plus SSU sw images of “SW v1“ and “SW v3“, - alternative via using multiple IRDs. Two IRDs with software “SW v1“ and one IRD with software “SW v3“.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Connect the IRD to live TV network. 2. Connect the IRD to internet. 3. Make sure the IRD has “SW v1” installed. 4. Perform factory reset to the IRD and complete the “first time” installation. During installation, enable/ensure IRD still connected to Internet. 5. Tune the IRD to a TV service (from the live TV network). 6. Fill in the test results if the IRD has a setting for automatic search and it is set to “auto search”. 7. Access the navigator. Look for a menu option for SSU over the Internet. 8. Enable SSU download over the Internet. 9. Verify that the software in the IRD is updated to “SW v2”. 10. Fill in the test protocol. 11. Perform factory reset to the IRD and new installation. During installation, enable network connection on the IRD. 12. Enable SSU download over the Internet. 13. Verify that no software update occurs. 14. Fill in the test protocol |

| | <p>15. Install/change the IRD software to “SW v3” (<i>OTN server still has SW v2</i>).</p> <p>16. Perform factory reset to the IRD and new installation. During installation, enable network connection on the IRD.</p> <p>17. Enable SSU download over the Internet.</p> <p>18. Verify that no software update occurs.</p> <p>19. Fill in the test protocol</p> <p>20. Install/change IRD software to “SW v1” (<i>OTN server still has SW v2</i>).</p> <p>21. Initiate the download again using steps 7-8.</p> <p>22. During the download (step 8), remove the power cable to corrupt the downloading of the system software.</p> <p>23. Wait 10 seconds and then re-insert the power cable.</p> <p>24. Verify that the IRD is still usable.</p> <p>25. Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc.</p> <p>26. Initiate the download again.</p> <p>27. Cut the network connection temporarily by e.g. disabling the network access point uplink.</p> <p>28. Re-enable the network connection.</p> <p>29. Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc.</p> <p>Expected result: IRD performs a software update over-the-network.</p> | | | | | | | | | | | | | | | | | | | | | | | |

| Test Case | Task 11:5 IRD System software update using USB update |
| Section | NorDig Unified 10.1, 10.2 and 10.3 |
| Requirement | <p>The NorDig IRD which is relying on OTN updates shall also provide a USB mechanism that enables the download of software to an IRD.</p> <p>As many devices will need to be upgraded during their certification time, that upgrade process should be used as the basis for this test rather than having a dedicated test step where special softwares are required.</p> <p>The actual upgrade of NorDig IRD software shall be initiated by the user, in this case after inserting a USB device into one of the IRDs USB slot.</p> <p>Any notification to the user (pop-up message) related to SSU shall be displayed in the same language as the language setting of the IRD.</p> <p>The IRD manufacturer shall ensure that download of non-certified system-software is prevented.</p> <p>The NorDig IRD shall be implemented with a protection mechanism for the existing system software. It shall ensure that the existing software will not be corrupted in case the System Software Update (SSU) is interrupted before the new system software is fully installed.</p> <p>The NorDig IRD shall be provided with a mechanism ensuring that only newer software versions than the existing System Software are accepted.</p> |
| IRD Profile(s) variants and capability | all IRDs using OTN and/or USB SSU profile |
| Test procedure | <p>Purpose of test:</p> <p>To verify the IRD system software update process using the USB interface.</p> <p>The SSU end user functionality is not tested in this case. It is tested in Task 11:6 SSU end user functionality.</p> <p>This test is convenient to do parallel with Task 11:6 SSU end user functionality.</p> <p>Equipment:</p> <p>Test setup described in 2.11.1 Test equipment summary</p> <p>For testing three IRD software versions are needed:</p> <p>Software “SW v1”, version on USB memory stick, to test IRD does not downgrade.</p> <p>Software “SW v2”, version on USB memory stick, to test upgrade</p> <p>Software “SW v3”, version on USB memory stick (special version, only for testlab usage) to allow downgrade SW version during SSU testing.</p> <p>NOTE: to perform the USB test it is not necessary for the IRD to be connected to either the Broadcast Network or the Internet.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Connect the IRD to the live TV network 2. Make sure the IRD has “SW v1” installed |

| | <ol style="list-style-type: none"> 3. Perform factory reset to the IRD and complete the “first time” installation. 4. Tune the IRD to a TV service (from the live TV network). 5. Fill in the test results if the IRD has a setting for automatic search and it is set to “auto search” 6. Insert the USB device containing the software “SW v2” update (in the format recommended by the manufacturer) 7. The IRD may recognize the USB device and if the IRD offers to perform the SSU at that time accept the offer. 8. Else navigate through the system menu to the Software update screen and select ‘Manual Update’ (or nearest equivalent) 9. Verify that the software is updated to “SWv2” 10. Fill in the test protocol. 11. Perform factory reset to the IRD and complete the “first time” installation. 12. Insert the USB device containing the software “SW v2” update (in the format recommended by the manufacturer) 13. The IRD may recognize the USB device and if the IRD offers to perform the SSU at that time accept the offer. 14. Else navigate through the system menu to the Software update screen and select ‘Manual Update’ (or nearest equivalent) 15. Verify that no software update occurs. 16. Fill in the test protocol. 17. Install software “SW v3” version of the IRD software to downgrade the IRD software version using steps 6-8. 18. Verify that the software is updated to a lower version. Note this is a special process to be used only during testing and is not considered a ‘real world’ test. 19. Now using the software “SW v1” again initiate the installation again using steps 6-8. 20. During the update process (step 7 or 8), remove the power cable to corrupt the installation of the system software. 21. Wait 10 seconds and then re-insert the power cable. 22. Verify that the IRD is still usable. 23. Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc. 24. Using the software “SW v1”, initiate the installation again using steps 6-8. 25. During the update process (step 7 or 8), remove the USB stick to corrupt the installation of the system software. 26. Verify that the IRD is still usable. 27. Fill in the test protocol. Fill in extended information in the comments section if the IRD ends up in an error state. Error messages etc. <p>Expected result: IRD performs a software update from the USB source</p> | | | | | | | | |

2.12 Task 12: Performance

| | |
|------------------|------------------------------------|
| Test Case | Task 12:1 Video performance |
| Section | NorDig Unified 11.2 |

| | |
|--|---|
| Requirement | Measurement results which comply with NorDig Unified requirements. |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To verify video performance for RGB and PAL output signals.</p> <p>This test is mandatory if the IRD has analog video output.</p> <p>Test Equipment: Test signals are created using the test bed shown below:</p>  <pre> graph LR A[MPEG 2-source] --> B[Multiplex] B --> C[DVB-S/C/T Modulator] C --> D[Up Converter] D --> E[DVB Receiver] E --> F[Video analyzer] G[PC Sigen] --> B </pre> <p>Test signal configuration: A transport stream containing a video signal with a number of Insertion Test Signals (ITS) is used. The signals employed for this test is a TV-line with black luminance, a TV-line containing the CCIR 17 test signal and a TV-line containing (sin x)/x pulses. Another transport stream containing CCIR 331 test signal is used to check chroma/luma intermodulation. LO Phase noise not measured.</p> <p>Test procedure: Measurements of test signal response at RGB and PAL output</p> |

2.13 Task 13: Service Information

2.13.1 General

These test tasks differ from the normal NorDig division of the test tasks. These test tasks are not listed in that order as the requirements appear in NorDig specification. Instead the order of the test tasks are divided in to a order how the different information data shall be able to be retrieved, handled and updated by the **NorDig IRDreceiver**. This division in this context is defined as following:

- ➔ Static PSI/SI data is defined as a data that must be updated by the **IRDreceiver** in the channel search or first time initialization.
- ➔ Quasi static PSI/SI data is defined as a data that must be updated by the **IRDreceiver** when it is toggled between stand-by mode and active mode or vice versa.
- ➔ Dynamic PSI/SI data is defined as a data that must be updated by the **IRDreceiver** whenever a change in the data occurs.

In order to maintain the reference to requirements, in every test task, the requirement from the specification is referenced.

| | |
|---|--|
| Test Case | Task 13:1 SI: General |
| Section | NorDig Unified 12.1 |
| Requirement | <p>The NorDig IRD shall at least start updating for any changes in the received “quasi-static” SI data after it returns to active from stand-by mode. “Quasi static” SI-data includes NIT and SDT, i.e. SI that is typically stored in the flash memory for service navigations, such as service name, service_ID, number of services.</p> <p>The NorDig IRD shall at least start action for any changes in the received “dynamic” PSI and SI data, (PMT, EIT, TDT/TOT, running status and CA mode) within 1 second. (As a guideline for the implementation, the trigger for changes in received tables can be based on comparing the ‘version id’ in the tables).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | This is general requirement that will be test in following tests. |

| | |
|---|--|
| Test Case | Task 13:2 SI: General – Undefined data structures |
| Section | NorDig Unified 12.1 |
| Requirement | Descriptors or other data structures that are currently undefined or are unknown to NorDig IRD shall be skipped and shall not cause any harm. This means for example that NorDig IRD shall ignore/skip the complete text string that is using DVB character tables that the IRD does not support. |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | Purpose of test: Confirm the proper function |

| | |
|--|---|
| | Test procedure: It is a general requirement, which is tested, in the following tests. |
|--|---|

| | |
|---|---|
| Test Case | Task 13:3 SI: General – ‘Actual’ and ‘Other’ tables |
| Section | NorDig Unified 12.1 |
| Requirement | <p>The IRD shall be able to process the PSI/SI tables, both for the ‘Actual’ and for ‘Other’ transport streams.</p> <p>The NorDig IRD shall be able to process the PSI/SI tables, both for the ‘Actual’ and for ‘Other’ transport streams. SI tables for the ‘Other’ transport streams, SI_{other}, should be seen as informative and shall always be double checked with the corresponding SI tables for the ‘Actual’ transport stream, SI_{actual}.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | This is a general requirement, which is tested, in the following tests. |

| | |
|---|---|
| Test Case | Task 13:4 SI: SI data available through an API (HbbTV) |
| Section | NorDig Unified 15.2 12.4 |
| Requirement | <p>The NorDig HbbTV IRD shall support all mandatory features and requirements of HbbTV v2.0.2 as specified in ETSI TS 102 796 v1.5.1 specification or later version, including the most recently published errata from the HbbTV Association.</p> <p>The NorDig IRD with an HbbTV based profile (NorDig HbbTV shall support all the DVB SI additions as defined in the HbbTV v. 1.5 ETSI TS 102 796 v.1.2.1 specification [30]).</p> |
| IRD Profile(s) variants and capability | Hybrid, IRD, FE HbbTV IRD |
| Test procedure | <p>This means that the NorDig HbbTV IRD shall support all the DVB SI additions as defined in the HbbTV ETSI TS 102 796 specification.</p> <p>In case of NorDig Basic IRD without HbbTV API: Not tested.</p> <p>In case of NorDig HbbTV IRD Enhanced: This test is part of the HbbTV Test Suite. Not tested here</p> |

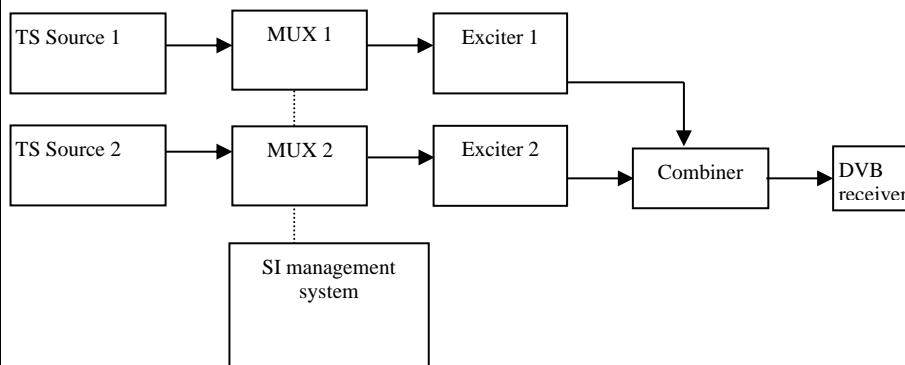

| | |
|-----------------------|---|
| Test Case | Task 13:5 SI: Text strings and field size of the SI descriptor |
| Section | NorDig Unified 12.1.7 |
| Requirement | <p>The NorDig IRD shall support the character tables specified in Table 12.4.</p> <p>The NorDig IRD shall support the character tables specified in Table 12.4. Respective character table in NorDig transmission is signalled by using bytes in the beginning of text field according to ETSI EN 300 468 Annex A.2 and as reproduced for convenience in Table 12.4.</p> |
| IRD Profile(s) | Basic, IRD, FE all IRDs |

| variants and capability | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|--|-------------------|----------------------|------------|---------------------|------------|---------------------|----------------|-----------------|-----|-----|-----|--|----------------------|----------------|------|-----|-----|--|----------------|----------------|------|------|------|--|

2.13.2 Static PSI/SI data

| | |
|--|--|
| Test Case | Task 13:6 NIT_actual – frequency_list_descriptor |
| Section | NorDig Unified 12.2.7 |
| Requirement | <p>12.2.1 The Network Information Table Descriptors</p> <p>NIT descriptors mandatory to receive and interpret if broadcasted for NorDig terrestrial IRDs:</p> <p>Network_name_descriptor Service_list_descriptor Terrestrial_delivery_system_descriptor T2_Terrestrial_delivery_system_descriptor Linkage_descriptor Private_data_specifier_descriptor Frequency_list_descriptor Nordig Logic_channel_descriptor version 1 NorDig Logic_channel_descriptor version 2</p> <p>12.2.7 Frequency List Descriptor</p> <p>The Frequency List Descriptor lists frequencies where the transport stream occurs, in addition to the frequency given by the system delivery descriptor. (e.g. the transport stream is broadcast on the frequency given by the system delivery descriptor or broadcast on one of the frequencies given by the frequency list descriptor. This feature can be used in terrestrial networks where the same transport stream can be received on more than one frequency.)</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T, DVB-T2 Terrestrial IRD |
| Test procedure | <p>Purpose of test:</p> <p>To check that when there is not correct center_frequency signalled in terrestrial_system_delivery_desc, but the alternative frequencies are available in Frequency_list_desc.</p> <p>Note: This test is only for terrestrial IRDs.</p> |

Equipment:

| | Service1 | Service2 | |
|---|---|---|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN 1 visible | SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN 2 visible | NIT: ³⁾ terrestrial_system_delivery_ descriptor centre_frequency <i>f1</i> MHz frequency_list_descriptor centre_frequency <i>f3</i> MHz |
| MUX2 TS_id 2 Network_id 2 ON_id ¹⁾ | SID 2100 S_name Test21 S_type 0x01 PMT PID 2100 V PID 2109 A PID 2108 LCN 3 visible | SID 2200 S_name Test22 S_type 0x01 PMT PID 2200 V PID 2209 A PID 2208 LCN 4 visible | |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.

³⁾Frequencies *f1*, *f2* and *f3* shall be different.

Test can be made either upon DVB-T or DVB-T2 signals (for DVB-T2 then use instead T2_Terrestrial_delivery_system_descriptor).

Test procedure:

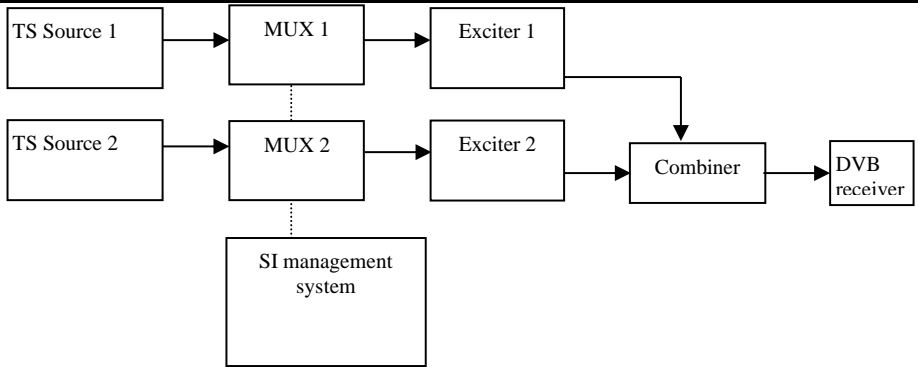

1. Transmit MUX1 at frequency *f1* and MUX2 at frequency *f2*.
2. Perform factory reset and new channel search.
3. Verify that services on MUX1 can be received correctly.
4. Zap to a service on MUX2.
5. Change the MUX1 frequency to *f3*.
6. Verify that the IRD is able to utilize the information given in the NIT frequency_list_descriptor and receive the services on MUX1.
7. Transmit MUX1 at frequency *f2* and MUX2 at frequency *f1*.
8. Perform factory reset and new channel search.
9. Verify that services on MUX1 and MUX2 can be received correctly.

Expected result:

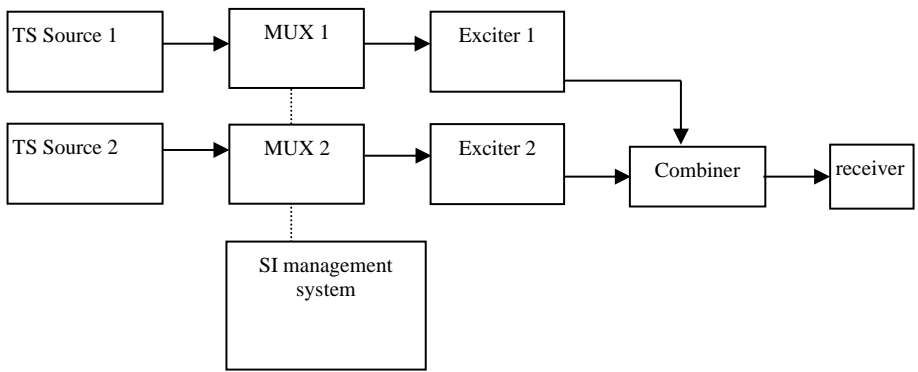

Terrestrial IRD is able to follow the frequency_list_descriptor and tune to the services, if there is an incorrect frequency in the terrestrial_system_delivery_descriptor. Incorrect centre frequency in frequency_list_descriptor does not cause any harm for the reception.

| Test Case | Task 13:9 SDT_actual service_descriptor and CA_identifier_descriptor |
| Section | NorDig Unified 12.2.6, 12.3.2 and 12.3.3 |
| Requirement | SDT descriptors mandatory to receive and interpret if broadcasted: Service_descriptor CA_identifier_descriptor Linkage_descriptor 12.3.3 CA Identifier Descriptor This descriptor may be present in the SDT when at least one service component is scrambled. The CA_system_id is allocated by ETSI and is given by ETSI ETR 162. The descriptor may be used statically (recommended). It will in that case be set according to the services regular/normal scrambling status. Alternatively, it may be used dynamically, in accordance with the current services scrambling status. This static use enables IRDs to “grey mark” services that cannot be descrambled due to lack of the required CA-system for the relevant service(s). It allows the IRD to display services that are only temporary (event based) scrambled. |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | Purpose of test: To check the support for the Service_descriptor and CA identifier descriptor (CA system id). Equipment: |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network)

CA_identifier_descriptor may be present in the SDT when at least one service component is scrambled. The CA_system_id is allocated by ETSI and is given by ETR-162. The descriptor may be used statically (recommended). It will in that case be set according to the services regular/normal scrambling status. Alternatively it may be used dynamically, in accordance with the current services scrambling status. This static use enables IRDs to “grey mark” services that cannot be descrambled due to lack of the required CA system for the relevant service(s). It allows the IRD to display services that are only temporary (event-based) scrambled.

Test procedure:

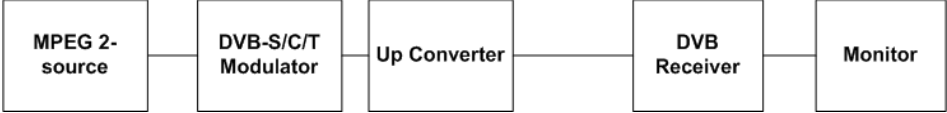

1. Verify that CA_identifier_descriptor is signaled in SDT_actual for another CA_system_id than supported by the receiverNorDig IRD (IRD embedded CAS or IRD with CI and a CAM). If the receiverNorDig IRD doesn't support any CA system, the used CA system in EIT_actual p/f can have any valid CA_system_id.
2. Do the first time initialization or a channel search
3. Verify that the service1 is displayed as non-available, e.g. “grey marked”.

Expected result:
The service1 is displayed as non-available by the receiver.

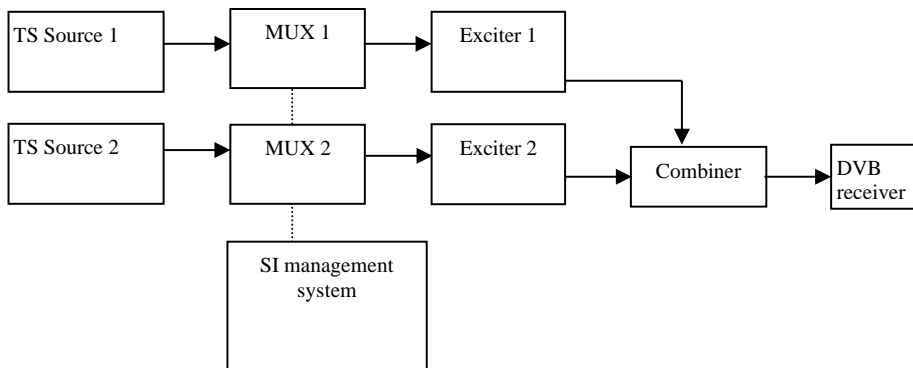

| | |
|-------------|---|
| Test Case | Task 13:11 Quasi-static update of SDT_actual – linkage to NorDig simulcast replacement service |
| Section | NorDig Unified 12.3.4 |
| Requirement | <p>0x82, NorDig Simulcast replacement service, linkage from an (MPEG2) SDTV based service to an (MPEG4 AVC) HDTV replacement service with the same content. It may be used during simulcasting of a service in both an SDTV and an HDTV version on separate service ids with same content within the same original network id. This linkage may be included in the (MPEG2) SDTV service (service_type 0x01) within the SDT pointing to the HDTV version (service_type 0x19) of the service. Whenever it is used, it will be used quasi-static.</p> <p>When an SDTV service includes this NorDig simulcast replacement service linkage (0x82) pointing to the HDTV version of the service, the NorDig HD IRDs that are able to receive both the SDTV and the HDTV services shall only include the HDTV version/(service) of the two services within its TV service list.</p> <p>(Clarification: If no ‘NorDig Simulcast replacement service’ linkage is included, both services shall be included. If only the (MPEG 2) SDTV version (service_type 0x01) is possible to receive (due to e.g. reception problems/limitations), the (HDTV) IRD shall include this service even if it carries a linkage ‘NorDig simulcast replacement service’).</p> <p>12.1.1 The NorDig IRD shall at least start updating for any changes in the received “quasi-static” SI data after it returns to active from standby mode. “Quasi static” SI-data includes NIT and SDT, i.e. SI that is typically stored in the flash memory for service navigations, such as service name, service ID, number of services. (The ‘running status’ is not included in the quasi-static SI data. As a guideline for the implementation, this updating may be performed in the background, to shorten the start-up of the basic video and audio).</p> <p>12.3.4 The following linkage_type value shall be interpreted by a NorDig IRD when used inside the SDT:</p> <p>0x82, NorDig Simulcast replacement service, linkage from one TV based service to another TV replacement service with the same content, typical usage it to hide/not include the “old” version of the service and only list the “new” version in the IRD’s service list. For example, it may be used during simulcasting of a service in both an (MPEG2/H.262) SDTV and an (AVC/H.264) HDTV version on separate service ids with same content within the same original network id, or during simulcasting an (AVC/H.264) HDTV and an (HEVC/H.265) UHD TV version with the same content. The linkage will be included in the SDT for the “old” TV service that is intended to be replaced (hidden) and pointing to the “new” replacement service. Whenever it is used, it will be used quasi-static.</p> <p>For NorDig IRDs that are able to receive both the “old” TV service that is intended to be replaced (hidden) and the “new” replacement service, they shall only include the “new” replacement TV version/(service) of the two services within its TV service list. The “old” TV service that is intended to be replaced (hidden) may be omitted or hidden at the end of the list, dependant of IRD implementation. The method shall be service type independent (1).</p> <p>Clarification: If no ‘NorDig Simulcast replacement service’ linkage is included, both services shall be included. If only the “old” TV service that is intended to be replaced</p> |

| | <p>(hidden) is possible to receive and decode and not the new replacing service (due to e.g. reception problems or codec/service type limitations), then then NorDig IRD shall include and display the “old” TV service that is intended to be replaced in the service list even if it carries this linkage ‘NorDig simulcast replacement service’.</p> <p>Note1: NorDig IRDs that are launched before 1 July 2020, are allowed to support this only for MPEG2/H.262 SDTV services that are pointing to AVC/H.264 HDTV or HEVC/H.265 replacement services.</p> <p>Note: Broadcaster should not use this replacement from a higher service_type value (e.g. AVC/H.264) point to replacement service with a lower service_type value (e.g. MPEG2/H.262).</p> | | | | | | | | | | | | | | | | | | | | |

| Note 1: EIT schedule is optional for NorDig IRDs with IP-based Front-end. | | | | | |
| Note 2: NorDig PVR only. | | | | | |
| 13.3.2.1 Dynamic update of EIT data | | | | | |
| The EIT data shall be treated as dynamic information which means that the EIT data is often updated by the broadcaster several times during a day, for example | | | | | |
| <ul style="list-style-type: none">• The description of events may be changed/updated from when the event was first “published”/broadcasted,• Some events may be re-scheduled,• Past events from current day may be removed from broadcast etc. | | | | | |
| As factory default, the NorDig IRD shall continuously monitor and update the ESG without user request to update (for example by monitoring the tables’ version ids). Information in the ESG shall be updated within 10 second after reception of the updated tables. | | | | | |
| 13.3.2.3 Time periods with no EIT data or missing EIT data | | | | | |
| If services have gaps in the EIT data or if services have no or missing EIT data the ESG shall not display an error message (i.e. it shall not give the impression for the user that IRD or the EIT data is faulty), instead the text information field should stay empty or display informative text (like “No event information”), see recommendation of informative text in Annex F. A gap in the EIT data refers here to a gap in time between one event ends (start_time + duration) to the next event starts (start_time) for a service. An example could be that when the IRD is still caching the EIT data (e.g. after startup) do not display any text information for events and services that are missing EIT data (typically due to that the IRD has yet not received that EIT data) and after a reasonable long time of caching (for example after analysing last_section_number etc) for missing EIT data then display informative text. | | | | | |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs | | | | |
| Test procedure | Purpose of test: To check that relevant contents of the EIT actual/other p/f are decoded and displayed correctly. For the case with EIT present/following (p/f) in all TSs and all EIT containing cross carried EIT data (actual/other, a/o) for all services in network, verify that the NorDig IRD can: <ul style="list-style-type: none">1. Handle (decode and display) EIT actual p/f information (e.g. from Mux1, display info about Mux1 services)2. Handle (decode and display) EIT other p/f information (e.g. from Mux1, display info about Mux2 services)3. Handle dynamic update of EIT actual/other p/f information in info banner/ESG.4. Following EIT descriptors to be tested:<ul style="list-style-type: none">- Short_event_descriptor- Extended_event_descriptor5. Handle time periods with no EIT data or missing EIT data. NorDig IRD’s Info banner refer to display via a Graphical User Interface (as defined by the IRD manufacturer) more basic information of the selected service, for example when user press info function/key on remote control or for a shorter time period when changing/zapping service. The info banner can typically display event name of present event or present and following event for the selected service, start time, end time, present | | | | |

time, relevant part of content and component information (and may also incl information relevant to viewer from PMT) etc.

NorDig IRD's **ESG/Guide** ("EPG") refers to display via a Graphical User Interface (as defined by the IRD manufacturer) program event information of ALL the services in the IRD's service list, for example when user press ESG/(EPG)/navigator function/key on remote control. The ESG typically display 8-day schedule information for the services, for example in a grid view or similar.

Equipment:

| | Service1 | Service2 | SI | Frequency |
|---|--|---|--|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 PMT PID 1100 V PID 1109 A PID 1108 Logical_chan_desc 1 visible | SID 1200 S_name Test12 PMT PID 1200 V PID 1209 A PID 1208 Logical_chan_desc 2 visible | EIT (PID 18) actual/other p/f - present /following a/o - (optional schedule*) | Can be chosen depending of the distribution media. |
| MUX2 TS_id 2 Network_id 2 ON_id ¹⁾ | SID 2100 S_name Test21 PMT PID 2100 V PID 2109 A PID 2108 Logical_chan_desc 3 visible | SID 2200 S_name Test22 S_type 0x01 PMT PID 2200 V PID 2209 A PID 2208 Logical_chan_desc 4 visible | EIT (PID 18) actual/other p/f - present/following a/o - (optional schedule*) | Can be chosen depending of the distribution media. Not same as for Exciter 1 |

¹⁾ ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.

²⁾ Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

EIT abbreviations; p/f: present and following sections, a/o: actual and other sections, sch: scheduled sections.

1. The test setup Network shall at least consist of two or more MUXes/TSs and shall at least consist of two services per MUX.
2. MUX1 services' event information (EIT actual p/f) is cross-distributed to MUX2 as event information (EIT other p/f).
3. MUX2 services' event information (EIT actual p/f) is cross-distributed to MUX1 as event information (EIT other p/f and schedule).
4. (at least) One of the visible services in MUX1 shall have no EIT information and the other services (in MUX1, MUX2...) shall have EIT information.
5. For one of the visible services in MUX2 shall for some time periods in EIT stream be "empty" without short or extended event descriptor (ie gaps in schedule).

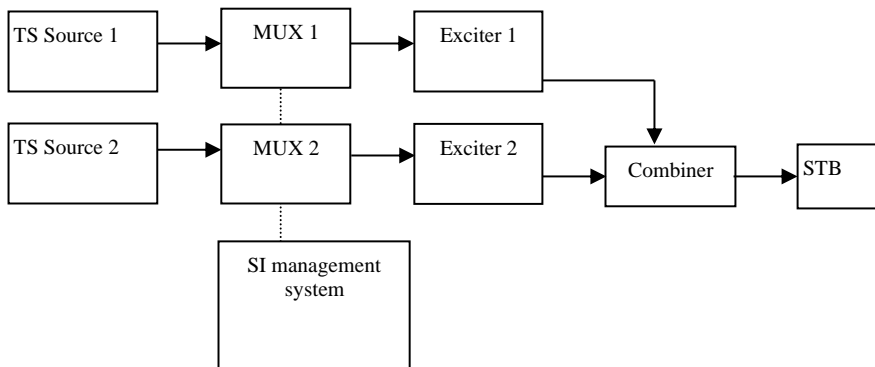

| | |
|-----------------------|--|
| | <p>6. The EIT shall at least contain one language (may contain several languages) and at least the language that is intended to test for.</p> <p>7. *) If EIT carries both EIT p/f and schedule then the EIT p/f text strings should differ some compared to same events in EIT schedule, to make it possible to indentify if IRD uses data from EIT p/f or EIT sch sections.</p> <p>Test procedure:</p> <p>1. Verify that there is one visible service with EIT information signalled on MUX1, one visible service without EIT signalled on MUX1 and one service with EIT signalled on MUX2.</p> <p>2. Launch navigator.</p> <p>3. Check that service with and without EIT signalled is displayed correctly.</p> <p>4. Verify that the EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information)</p> <p>1. Turn on NorDig IRD.</p> <p>2. Do re-initialization or make sure there are no services in channel list or in ESG. Set IRD's language to one of the languages in the EIT.</p> <p>3. Do channel search and verify that IRD has installed in channel list all (four) services.</p> <p>4. Choose a service in MUX1 which EIT data and access the info banner.</p> <p>5. Check that the information on info banner is correct (EIT actual p/f).</p> <p>6. Keep the same service, but zap using the info banner to an other services.</p> <p>7. Check that the information on info banner is correct (EIT other p/f), service(s) without EIT data or gap between program events shall be presented without an error message.</p> <p>8. Verify that the IRD can via info banner (or via ESG/Guide) for selected service and then for an other service display; start time, end time/duration, from short descriptor [event name, (initial) event description], from extended event descriptor [extended event description],. The the event text description from extended event description shall be displayed as a continuation from the event description from the short event descriptor.</p> <p>9. Change the information for a program event of a service: change start time, duration.</p> <p>10. Check that the changes are updated in info banner.</p> <p>11. Change the information for a program event of a service: change event name, and event description.</p> <p>12. Check that the changes are updated in info banner.</p> <p>Expected result:</p> <p>The IRD shall display the information signalled in EIT from MUX1 and MUX2 correctly in info banner/ESG navigator inclusive all the descriptor defined above.</p> <p>The IRD shall not display error message for the service, which don't have EIT signaled or gap between two events, on MUX1.</p> <p>The ESG has equal layout for all services in one service type.</p> |

1. The test setup Network shall at least consist of two or more MUXes/TSs and shall at least consist of two services per MUX. MUXes/TSs shall have cross-distributed EIT.
 2. The EIT stream test setup shall contain:
 - two or more languages for a service were at least one language match IRD selected language in user preferences for each language tests. (Should test both for 'actual' services from present TS/MUX1 and for 'other' services from other TS/MUX2)
 - one or more languages for a service were none of languages match IRD selected language in user preferences. (Here the IRD shall present event text strings from EIT data for one language even if no match, if several none-matching to select among then it is up to IRD manufacture which is chosen).
- This could for example be via different services contain cases above or different EIT test streams for each case

Test procedure:

1. ~~Check that the descriptors above are signalled for the two tables EIT actual and other p/f~~
 2. ~~Choose a service which have descriptors signalled and access the info banner.~~
 3. ~~Check that the information on info banner is correct (EIT actual p/f).~~
 4. ~~Keep the same channel, but zap using the info banner to an other service.~~
 5. ~~Check that the information on info banner is correct (EIT other p/f).~~
 6. ~~Change the information in content_descriptor to Movie/Drama, News/Current affairs, Show/Game show, Sports, Children's/Youth programmes, Music/Ballet/Dance, Arts/Culture (without music), Social/Political issues/Economics, Education/ Science/Factual topics and Leisure hobbies, in hexadecimal values 0x1-0xA respectively.~~
 7. ~~Check that the changes are updated in info banner.~~
1. Ensure that the NorDig IRD has installed services in from all test Muxes.
 2. Set IRD's language in user preferences to the first language to be tested.
 3. Select one service from Mux1 that contain multiple languages in EIT, one matching IRD language setting, open info banner.
 4. Check that the language in text strings in info banner from the EIT data matches the selected language setting of the IRD, (if supported by IRD check both event name, event description from both short and extended descriptor), note result in test result.
 5. If IRD in info banner can present event info of services from 'other' services in other TS, "zap" inside info banner to service in 'other' TS/Mux2 (while still decoding service from Mux1).
 6. Check that the language in text strings in info banner from the EIT data matches the selected language setting of the IRD, (if supported by IRD check both event name, event description from both short and extended descriptor), note result in test result.
 7. Open up the ESG
 8. Check that the language in text strings in ESG from the EIT data matches the selected language setting of the IRD for both 'actual' service (Mux1) and for 'other' service (Mux2), (check both event name, event description from both short and extended descriptor), note result in test result, note result in test result.
 9. Continue the test to set IRD's language in user preferences to the next language to be tested, perform step 3-8 until all languages that is intended to be tested is tested.
 10. Select one service from Muxes (or a EIT test stream) that do NOT contain sny matching languages in EIT compared to the IRD language setting, open ESG.
 11. Check that IRD present text strings in ESG from one of the available language(s) for the service EIT data.

| | Expected result: The info banner shows the information signalled in descriptors above and it is changed the information is updated. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Test procedure

Purpose of test:

To check the support for the following descriptors in EIT p/f:

Content_descriptor (because it is needed in component_descriptor)

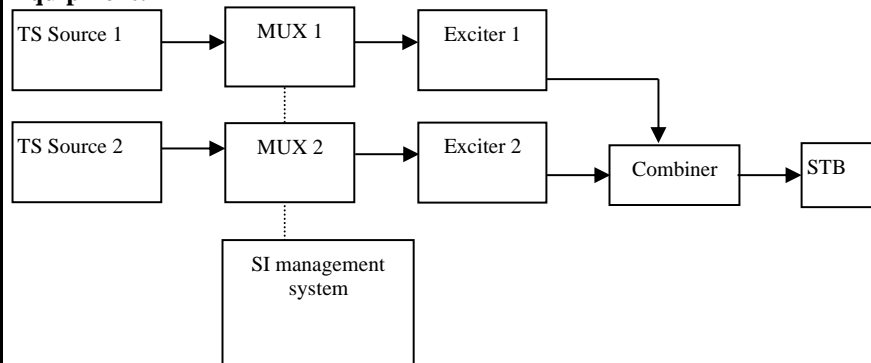

Component_descriptor

This test is a subset of the all combinations of values defined for content_descriptor / component_descriptor. The following combinations are tested:

| Stream_content and stream_content_ext | Component_desc | Language |
|---------------------------------------|---|--------------------------|
| 0x1 | 0x03 (MPEG2) SD video, 16:9, 25Hz without pan vectors | swe/fin/nor/dan/ice/sami |
| 0x3 | 0x20 (DVB) subtitling hard-of-hearing | swe/fin/nor/dan/gle/sami |
| 0x4 | (AC3) multichannel | |
| 0x5 | 0x03 (MPEG4 AVC) SD video, 16:9, 25Hz | swe/fin/nor/dan/gle/sami |
| 0x5 | 0x0B (MPEG4 AVC) HD video, 16:9, 25Hz | swe/fin/nor/dan/gle/sami |
| 0x6 | 0x03 (HE-AAC) stereo normal | swe/fin/nor/dan/gle/sami |
| 0x6 | 0x05 (HE-AAC) multichannel normal | swe/fin/nor/dan/gle/sami |
| 0x6 | 0x44 (HE-AAC) audio description | swe/fin/nor/dan/gle/sami |
| 0x9 0x0 | 0x04 (HEVC) UHD SDR | swe/fin/nor/dan/gle/sami |
| 0x9 0x0 | 0x05 (HEVC) UHD HDR (PQ) | swe/fin/nor/dan/gle/sami |
| 0x9 0x1 | 0x04 (AC4) multichannel normal (HEVC IRDs) | swe/fin/nor/dan/gle/sami |
| 0x9 0x1 | 0x08 (AC4) audio description | swe/fin/nor/dan/gle/sami |

This test is a subset of the all of values defined for content_descriptor, the test should be for all content_nibble_level_1 categories (0x0, 0x1, 0x2...0xB).

|--------------------|--|
| Test Case | Task 13:21 Dynamic update of EIT actual/other p/f parental_rating_descriptor |
| Section | NorDig Unified 13.3.2.4 |
| Requirement | The IRD manufacturer shall provide a procedure that allows the user to configure blanking of video and muting of sound for certain parental rating values (in parental_rating_descriptor in the EIT p/f). 13.3.2.4 Parental Control from EIT data |

| | |
|--|---|
| | <p>The parental rating descriptor is used to give a rating of programme events based on age or other criteria and is used to prevent children from viewing unsuitable programme events. Parental rating may differ from one country to another, according with DVB SI Guidelines (ETSI TS 101 211). The typically case is that parental rating is dynamic and varies from one program event to another for one service.</p> <p>The NorDig IRD shall provide a parental rating functionality that, when enabled, blanks video and mutes sound out of the IRD whenever the incoming rating value in the parental rating descriptor of the EIT data of current viewed programme event (present event) is higher than IRD's user setting. The user shall be able to enable and disable the parental functionality and when enabled to configure a minimum age/level (in years). It should make use of 4 digits pin code or similar to access and change settings (a technique that prevent easy access for a child). See section 16 for factory default user preference settings.</p> <p>The IRD may/should in addition offer the viewer a fast way of temporary disable blanking and muting of a service with higher rating than settings via user entering pin code or similar. This temporary disable of parental rating should continue as long as IRD stays on selected service and go back to user preference settings after change of service or re-start of IRD.</p> <p>The IRD should start/(stop) its blanking video and muting audio within 1 second after reception of selected service's present event information containing parental rating higher/(lower) than its user settings but shall at least within 10 seconds react after reception of parental rating information in the EIT data.</p> <p>For NorDig PVR see also section 14.3.9 Full Service Recording and section 14.4.5 Full service playback.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To check that muting of audio and blanking of video works based upon value in EIT present section parental rating descriptor for selected service.</p> <p>Equipment:</p>  <pre> graph LR TS1[TS Source 1] --> MUX1[MUX 1] TS2[TS Source 2] --> MUX2[MUX 2] MUX1 -.- SI[SI management system] MUX2 -.- SI MUX1 --> Exc1[Exciter 1] MUX2 --> Exc2[Exciter 2] Exc1 --> Comb[Combiner] Exc2 --> Comb Comb --> STB[STB] </pre> |

| | Service1 | Service2 | | Frequency |
|---|---|---|---|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN 1 visible EIT for service, - initial/first (present) program event, parental rating: low (e.g. 3years), - next second event, parental rating: high (e.g. 15 years), - third program event parental rating: low (e.g. 5years) | SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN 2 visible EIT for service, present program event, parental rating: high (e.g. 15years) | | Can be chosen depending of the distribution media. |
| MUX2 TS_id 2 Network_id 2 ON_id ¹⁾ | SID 2100 S_name Test21 S_type 0x01 PMT PID 2100 V PID 2109 A PID 2108 LCN 3 visible | SID 2200 S_name Test22 S_type 0x01 PMT PID 2200 V PID 2209 A PID 2208 LCN 4 visible | Bouquet SI All information in EIT. | Can be chosen depending of the distribution media. Not same as for Exciter 1 |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

²⁾Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

Test procedure:

1. Make sure that parental control is enabled in the NorDig IRD settings and that age level/setting is set to a value in the middle of the range, in order to test events with lower and higher parental rating value (e.g. 12 years). The EIT data at the start of the test shall for Service1's present event (first event) have a low parental rating value (lower than IRD's initial parental control setting) and next program event for Service1 high parental value (higher than IRD's initial parental control setting).
2. Verify that first present current program event in EIT for Service 1 on MUX 1 has lower parental_rating in EIT data than the parental_rating settings allowed in the preferences of the NorDig IRD on MUX 1.
3. Zap to channel Service 1 on MUX 1 and verify that video is visible and audio is audible.
4. Verify that next program event ("second event") for Service 1 on MUX 1 in the current a services EIT information is signalled for higher parental_rating as allowed in preferences of the NorDig IRD on MUX1
5. Let the NorDig IRD continue decoding Watch service1 until the EIT event information is changed to next program event (ie the second program event becomes present) and verify that EIT present information is updated to the next program event (i.e. to a program event which has higher parental rating than IRD's parental control setting).
6. Verify that the video is blanked and the audio is muted (the IRD may display information message OSD to viewer of reason for blanking and muting).
7. Let the NorDig IRD continue decoding Watch the Service1 until the EIT event information is changed to next program (ie the third program event becomes present), and verify that EIT present information is updated to the next program event (i.e. to a program event which has the lower parental_rating as allowed in the IRD's preferences).
8. Verify that the video is visible and audio is audible after EIT_present update.

| | | | |
|-----------------------|---|-------------|--|
| | <p>9. Verify that the EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information).</p> <p>10. Zap to Service 2 on MUX 1 (which shall have higher parental rating than IRD's initial parental control setting) and verify that the video is blanked and the audio is muted. Zap back to Service 1 on MUX 1 and verify that video is visible and audio is audible (which shall have lower parental rating than IRD's initial parental control setting).</p> <p>Expected result:</p> <p>The IRD shall blank the video and mute the audio for ages that are not allowed to decode.</p> | | |

| | |
|--------------------|---|
| Test Case | Task 13:22 Dynamic update of EIT actual/other p/f and schedule in ESG using linkage 0x04 to EIT schedule (EIT in barker channel) |
| Section | NorDig Unified 12.4.7, 12.2.6, 13.3.1 and 13.3.2 |
| Requirement | <p>Upon user request for EIT schedule information, the IRD shall look for the reference using linkage descriptor mechanism in the NIT and perform a frequency re-tuning if necessary. Linkage type 0x04 ("Transport Stream containing complete network/bouquet SI") shall be used to refer to EIT schedule information.</p> <p>The ESG shall include the EIT present/following table.</p> <p>The NorDig IRD shall be able to handle situations when the EIT is not present.</p> <p>The ESG shall be non-discriminatory and display all services on equal basis.</p> <p>The ESG shall process and display the relevant content of the following tables (including start time, end time/duration, and content of all descriptors specified below)</p> <p>If information is missing (i.e. not included in the transmission) the ESG shall <u>not</u> display an error message, instead the text information field shall stay empty (i.e. no information like "no information available").</p> <p>Short_event_desc Extended_event_desc Component_desc Content_desc Parental_rating_desc CA_identifier_descriptor (optional)</p> <p>12.2.6 NIT Linkage Descriptor</p> <p>The following linkage_type values shall be interpreted by a NorDig IRD, when used inside the NIT:</p> <p>0x01, linkage to a service that contain information about the network 0x02, linkage to an EPG service (Test Plan, in NorDig this refer to an API based application (e.g. HbbTV) for the EPG service).</p> |

0x04, linkage to transport stream which carries EIT schedule information for all of the services in the network (i.e. “barker channel” service). (Test Plan, this refer to when a DVB network only carries EIT pf in all MPEG TS while the EIT schedule is only carried on one of the networks MPEG TSs and the other TSs points to this TS with this linkage).

0x09, linkage to DVB System Software Update service (bootloader), see section 10.

12.4.7 Event Information Table Schedule

Upon user request for EIT schedule information, the IRD **shall** look for the reference using linkage descriptor mechanism in the NIT and perform a frequency re-tuning if necessary. Linkage_type 0x04 (“Transport Stream containing complete network/bouquet SI”) **shall** be used to refer to EIT schedule information.

13.3 Event Schedule Guide (ESG)

The Event Schedule Guide (ESG) is part of the Navigator in the IRD and presents program event information for the user about its installed services via a Graphical User Interface (GUI) as defined by the IRD manufacturer.

13.3.1 ESG Requirements

13.3.1.1 ESG and length

The NorDig IRD **shall** be able to display an ESG for the user with a minimum of eight days (1) of schedule data, defined as whole days from present day and ahead according to ETSI EN 300 468. The ESG **shall** be based on the information from the EIT tables, see section 12.4 and ETSI EN 300 468.

Comment: Eight days of schedule data for the services within one NorDig network (original network) consists of typically of up to 2-4 MB of data per language.

Note 1: Support for EIT schedule is recommended (optional) for NorDig IRDs with IP-based Front-end

13.3.1.2 Proper handling of EIT data

The NorDig IRD **shall** maintain proper behaviour in case of the incoming event information data for the services exceeds the available free memory for the ESG and not affect the IRD’s basic service decoding and navigation.

If the NorDig IRD’s memory for the ESG is exceeded, then the NorDig IRD **shall** prioritize the event information nearest in time and first reduce the data most far ahead in time for all service, for example via using EIT table filtering (instead of reducing service by service). (If the user has made personalized favourite service list consisting of a subset of available services, then the NorDig IRD should first priorities favourite services and then events most nearest in time).

The NorDig IRD **shall** be able to handle situations when the EIT is not present.

13.3.1.3 ESG performance

The NorDig IRD **shall** maintain the full ESG up to date and be able to display the ESG within 10 seconds after selection, even if not all EIT sections have been received (in which case gaps may occur in timeline for some services). The NorDig PVR **shall** be able to present the ESG regardless of recording status (i.e. while recording or timeshifting an event, it **shall** be possible to present the ESG).

The NorDig IRD should cache EIT data during normal service viewing to speed up time to present a full ESG after selection.

The ESG **shall** be non-discriminatory and display all services on an equal basis.

The ESG **shall** process and display the relevant content of the following tables (including start-time, end-time/duration and content of all descriptors specified below incl 13.3.2 and 13.3.3).

13.3.2 Event Information Table (EIT)

NorDig IRD **shall** make use of the EIT p/f tables from both EIT_actual and EIT_other tables.

| Event descriptors | EIT p/f | EIT sch |
|-------------------------------------|---------|---------|
| Short_event_descriptor | M | M (1) |
| Extended_event_descriptor | M | M (1) |
| Component_descriptor | M | O |
| Content_descriptor | M | M (1) |
| Parental_rating_descriptor | M | M (1) |
| CA_identifier_descriptor (optional) | O | O |
| Content_identifier_descriptor (PVR) | M (2) | M (2) |

Table 2.22 EIT p/f descriptors

Note 1: EIT schedule is optional for NorDig IRDs with IP-based Front-end.

Note 2: NorDig PVR only.

13.3.2.1 Dynamic update of EIT data

The EIT data **shall** be treated as dynamic information which means that the EIT data is often updated by the broadcaster several times during a day, for example

- The description of events may be changed/updated from when the event was first “published”/broadcasted,
- Some events may be re-scheduled,
- Past events from current day may be removed from broadcast etc.

As factory default, the NorDig IRD **shall** continuously monitor and update the ESG without user request to update (for example by monitoring the tables’ version ids).

Information in the ESG **shall** be updated within 10 second after reception of the updated tables.

13.3.2.2 Multiple languages in EIT data

Some NorDig networks transmit EIT data in multiple languages; the NorDig IRD **shall** be able to display the EIT data from chosen language (according to user preferences).

13.3.2.3 Time periods with no EIT data or missing EIT data

If services have gaps in the EIT data or if services have no or missing EIT data the ESG **shall** not display an error message (i.e. it **shall** not give the impression for the user that IRD or the EIT data is faulty), instead the text information field should stay empty or display informative text (like “No event information”), see recommendation of informative text in Annex F.

IRD Profile(s)
variants and
capability

Basic, IRD, FE all IRDs

Test procedure

Purpose of test:

As an alternative to broadcast full EIT schedule in all MPEG TSs for a network, some networks broadcast the EIT on one of the networks TS (“barker channel”) due to limitation of bandwidth or similar reasons. In this case, all other TS (not containing EIT schedule) will have an reference into their NIT to this “barker TS” inside with linkage 0x04. Unless the IRD can cache the EIT schedule background without effecting/disturbing the normal TV viewing (for example for IRDs with multiple tuners), the IRD shall only tune to the barker TS when user selects the ESG function (“EPG” function).

For this case with EIT schedule in a barker channel, ~~Fe~~ verify that the NorDig IRD can:

- Handle EIT actual/other schedule information in ESG using the linkage_descriptor 0x04 (“Transport Stream containing complete

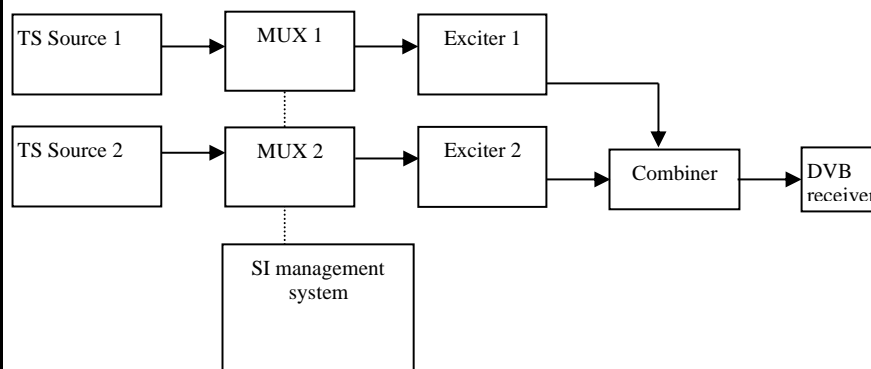

network/bouquet SI") in NIT (ie tune to TS containing EIT sch from the linkage and cache EIT sch data)

- Handle the dynamic update of EIT actual/other schedule information in ESG when using the linkage_descriptor 0x04 ("Transport Stream containing complete network/bouquet SI") in NIT.

The verify the handling of the EIT schedule descriptors in NorDig Basic receiver:

- Following EIT descriptors to be tested
 - o Short_event_descriptor
 - o Component_descriptor
 - o Extend_event_descriptor
 - o Parental_rating_descriptor
- 8 days of ESG
- that extended amount (more than 8 days) of EIT data do not cause problems
- EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information)
- Handle time periods with no EIT data or missing EIT data.

Equipment:

| | Service1 | Service2 | SI | Frequency |
|---|---|---|--|--|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN 1 visible | SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN 2 visible | NIT - Linkage 0x04 to Mux2 EIT (PID 18) - present/following a/o | Can be chosen depending of the distribution media. |

| Test Case | Task 13:23 Dynamic update of EIT actual/other p/f and schedule in ESG (cross carried EIT schedule in all TSS) |
| Section | NorDig Unified 13.3.1 and 13.3.2 |
| Requirement | <p>The ESG shall include the EIT present/following table.</p> <p>The NorDig IRD shall be able to handle situations when the EIT is not present.</p> <p>The ESG shall be non-discriminatory and display all services on equal basis.</p> <p>The ESG shall process and display the relevant content of the following tables (including start time, end time/duration, and content of all descriptors specified below</p> <p>If information is missing (i.e. not included in the transmission) the ESG shall <u>not</u> display an error message, instead the text information field shall stay empty (i.e. no information like "no information available").</p> <p>Short_event_desc Extended_event_desc Component_desc Content_desc Parental_rating_desc CA_identifier_descriptor (optional)</p> <p>13.3 Event Schedule Guide (ESG) The Event Schedule Guide (ESG) is part of the Navigator in the IRD and presents program event information for the user about its installed services via a Graphical User Interface (GUI) as defined by the IRD manufacturer.</p> <p>13.3.1 ESG Requirements 13.3.1.1 ESG and length The NorDig IRD shall be able to display an ESG for the user with a minimum of eight days (1) of schedule data, defined as whole days from present day and ahead according to ETSI EN 300 468. The ESG shall be based on the information from the EIT tables, see section 12.4 and ETSI EN 300 468.</p> <p>Comment: Eight days of schedule data for the services within one NorDig network (original network) consists of typically of up to 2-4 MB of data per language. <i>Note 1: Support for EIT schedule is recommended (optional) for NorDig IRDs with IP-based Front-end</i></p> <p>13.3.1.2 Proper handling of EIT data</p> |

The NorDig IRD **shall** maintain proper behaviour in case of the incoming event information data for the services exceeds the available free memory for the ESG and not affect the IRD's basic service decoding and navigation.

If the NorDig IRD's memory for the ESG is exceeded, then the NorDig IRD **shall** prioritize the event information nearest in time and first reduce the data most far ahead in time for all service, for example via using EIT table filtering (instead of reducing service by service). (If the user has made personalized favourite service list consisting of a subset of available services, then the NorDig IRD should first priorities favourite services and then events most nearest in time).

The NorDig IRD **shall** be able to handle situations when the EIT is not present.

13.3.1.3 ESG performance

The NorDig IRD **shall** maintain the full ESG up to date and be able to display the ESG within 10 seconds after selection, even if not all EIT sections have been received (in which case gaps may occur in timeline for some services). The NorDig PVR **shall** be able to present the ESG regardless of recording status (i.e. while recording or timeshifting an event, it **shall** be possible to present the ESG).

The NorDig IRD should cache EIT data during normal service viewing to speed up time to present a full ESG after selection.

The ESG **shall** be non-discriminatory and display all services on an equal basis.

The ESG **shall** process and display the relevant content of the following tables (including start-time, end-time/duration and content of all descriptors specified below incl 13.3.2 and 13.3.3).

13.3.2 Event Information Table (EIT)

NorDig IRD **shall** make use of the EIT p/f tables from both EIT_actual and EIT_other tables.

| Event descriptors | EIT p/f | EIT sch |
|-------------------------------------|---------|---------|
| Short_event_descriptor | M | M (1) |
| Extended_event_descriptor | M | M (1) |
| Component_descriptor | M | O |
| Content_descriptor | M | M (1) |
| Parental_rating_descriptor | M | M (1) |
| CA_identifier_descriptor (optional) | O | O |
| Content_identifier_descriptor (PVR) | M (2) | M (2) |

Table 2.23 EIT p/f descriptors

Note 1: EIT schedule is optional for NorDig IRDs with IP-based Front-end.

Note 2: NorDig PVR only.

13.3.2.1 Dynamic update of EIT data

The EIT data **shall** be treated as dynamic information which means that the EIT data is often updated by the broadcaster several times during a day, for example

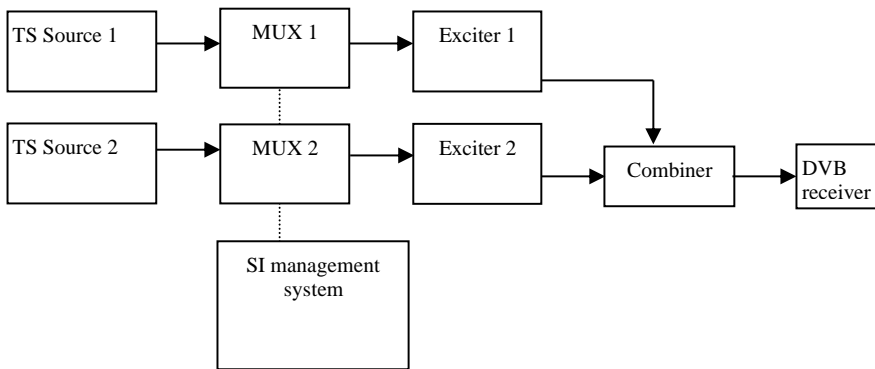

- The description of events may be changed/updated from when the event was first "published"/broadcasted,
- Some events may be re-scheduled,
- Past events from current day may be removed from broadcast etc.

As factory default, the NorDig IRD **shall** continuously monitor and update the ESG without user request to update (for example by monitoring the tables' version ids).

Information in the ESG **shall** be updated within 10 second after reception of the updated tables.

13.3.2.2 Multiple languages in EIT data

Some NorDig networks transmit EIT data in multiple languages; the NorDig IRD **shall** be able to display the EIT data from chosen language (according to user preferences).

| | |
|--|--|
| | <p>13.3.2.3 Time periods with no EIT data or missing EIT data</p> <p>If services have gaps in the EIT data or if services have no or missing EIT data the ESG shall not display an error message (i.e. it shall not give the impression for the user that IRD or the EIT data is faulty), instead the text information field should stay empty or display informative text (like “No event information”), see recommendation of informative text in Annex F.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>This is for testing the common case when network has EIT schedule cross carried (a/o) in all the networks’ TSs. The EIT cycling can be fairly long, especially for the events most far ahead (day8) which can be up to 10min. The IRD can cache EIT data in background from all services. The IRD shall be triggered by this alternative by the absence of linkage 0x04 (“Transport Stream containing complete network/bouquet SI”) in NIT (for IRDs supporting both alternatives).</p> <p>For this case with EIT p/f and schedule in all TSs and all EIT containing cross carried EIT data (actual/other) for all services in network, To verify that the NorDig IRD can:</p> <ul style="list-style-type: none"> - Handle EIT actual/other schedule information - Handle the dynamic update of EIT actual/other p/f and schedule information in ESG when EIT information is signaled complete per multiplex, with other words, without using the linkage_descriptor 0x04 (“Transport Stream containing complete network/bouquet SI”) in NIT. <p>The verify the handling of the EIT schedule descriptors in NorDig Basic receiver:</p> <ul style="list-style-type: none"> - Following EIT descriptors to be tested <ul style="list-style-type: none"> o Short_event_descriptor o Component_descriptor o Extend_event_descriptor o (Parental_rating_descriptor) - 8 days of ESG - that extended amount (more than 8 days) of EIT data do not cause problems - EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information) - Handle time periods with no EIT data or missing EIT data. <p>Equipment:</p>  <pre> graph LR TS1[TS Source 1] --> MUX1[MUX 1] TS2[TS Source 2] --> MUX2[MUX 2] MUX1 -.- SI[SI management system] MUX2 -.- SI MUX1 --> Exc1[Exciter 1] MUX2 --> Exc2[Exciter 2] Exc1 --> Comb[Combiner] Exc2 --> Comb Comb --> DVB[DVB receiver] </pre> |

- MUX1 event information (EIT actual p/f and schedule) is cross-distributed to MUX2 as event information (EIT other p/f and schedule).
- MUX2 event information (EIT actual p/f and schedule) is cross-distributed to MUX1 as event information (EIT other p/f and schedule).
- EIT schedule with 8 or more days of event data all services (preferable the EIT should contain more services and should include large amount of total EIT data)
- EIT p/f text strings should differ some compared to same events in EIT schedule.
- EIT schedule stream should include two or more languages for the events, where one of the languages is same as IRD selected user preference language.
- Some events in EIT stream should be "empty" without short or extended event descriptor.

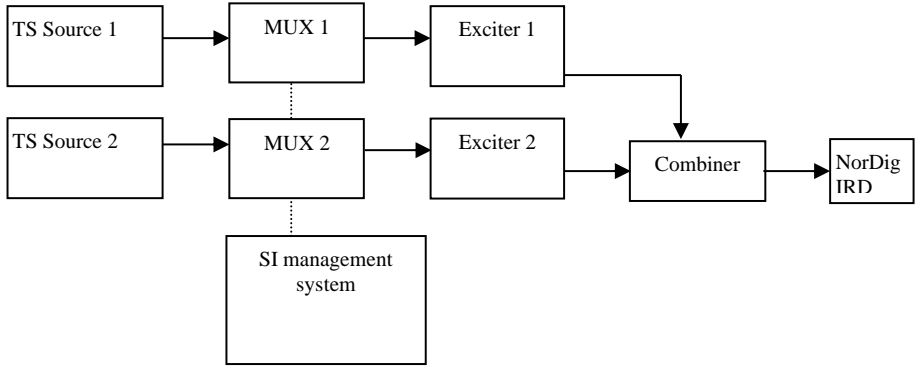

Test procedure:

1. Turn on NorDig IRD receiver.
2. Do re-initialization or make sure there are no services in channel list or in ESG. Set IRD's language to one of the languages in the EIT.
3. Do channel search.
4. Ensure that the IRD has selected service 2 from Mux 1
5. Check in channel list or ESG that there are all (four) services available.
6. Press the Info function, verify that the IRD present event info from EIT p/f. After this exit info function back to normal TV viewing.
7. Wait approx. one total cycling time for the EIT schedule data (approx. 5-10min, EIT data should typically be cached in background of TV viewing mode)
8. Press the Guide function button (IRDs can typically maintain service 2 in background, full 8-day ESG should be presented fast).
9. Check that the EIT information is displayed correctly as signalled for 8 days (current day + 7 full days – 24 hours) in EIT schedule. Check that language in presented EIT data is as expected (according to IRD language setting)..
10. Verify that extended amount (more than 8 days) of EIT data do not cause problems with the receiver IRD
11. Verify that the EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information).
12. Verify IRD can handle time periods with no EIT data or missing EIT data (ie not display an error message)

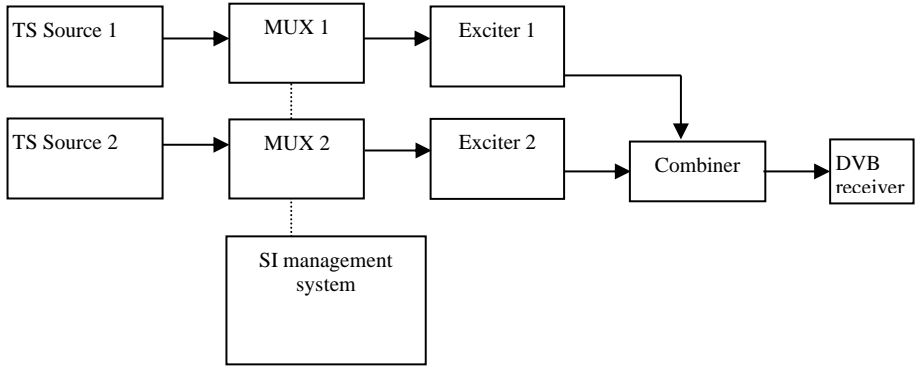

| | <div>13. Exit Guide/ESG function back to normal TV viewing, ensure that the IRD resume back to decoding service 2 in Mux1.</div> <div>14. Ensure that EIT schedule content is change some, in order to verify that the IRD handle updates of EIT schedule (e.g. changing description text some for some events).</div> <div>15. Press the Guide function again.</div> <div>16. Check that the EIT information is updated after some time and displayed correctly.</div> <div>Expected result:<ul style="list-style-type: none">- EIT information is displayed correctly as signalled in EIT actual/other p/f and schedule for following descriptors:<ul style="list-style-type: none">o Short_event_descriptoro Component_descriptoro Extend_event_descriptoro (Parental_rating_descriptor)- 8 days of ESG. EIT sections transmission is based upon UTC time and break of day is in UTC time, meaning for example a case where the network/country has currently +1h offset to UTC, the 8 day of ESG shall be from current time and present weekday (for example Monday 1st January 15:00 local time) until full +7 UTC days (in this example Tuesday 9th January 01:00 local time, ie Monday 8th January 24:00/Tuesday 9th January 00:00 UTC time).- that extended amount (more than 8 days) of EIT data do not cause problems- EIT p/f has priority over EIT schedule in navigator (in case if the EIT p/f and EIT schedule has a conflict in EIT information- Handle time periods with no EIT data or missing EIT data.</div> | | | | | | | | | | | | | | | | |

|--------------------|--|
| Test Case | <p>Task 13:26 Dynamic update of PMT-Component priority (stream type)</p> <p><Below is the only remaining part for section 13. This test task is separated into video and audio tasks, audio is moved into audio chapter and reference from SI test task to audio section, and same move video to video chapter or keep in SI chapter. Make reference also to subtitling></p> |
| Section | NorDig Unified 12.6.3 |
| Requirement | <p>NorDig IRDs shall ignore advanced audio streams when it does not support such decoding those streams.</p> <p>For example, an IRD that do not include any AC-3 (down-mix) decoder, (maybe only supports pass-through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritising.</p> <p>For video decoding, NorDig IRDs shall select the service's video components, and set the default setting in accordance with the priority list in Table 6.1.</p> <p>Component priority when multiple video or audio streams are received</p> |

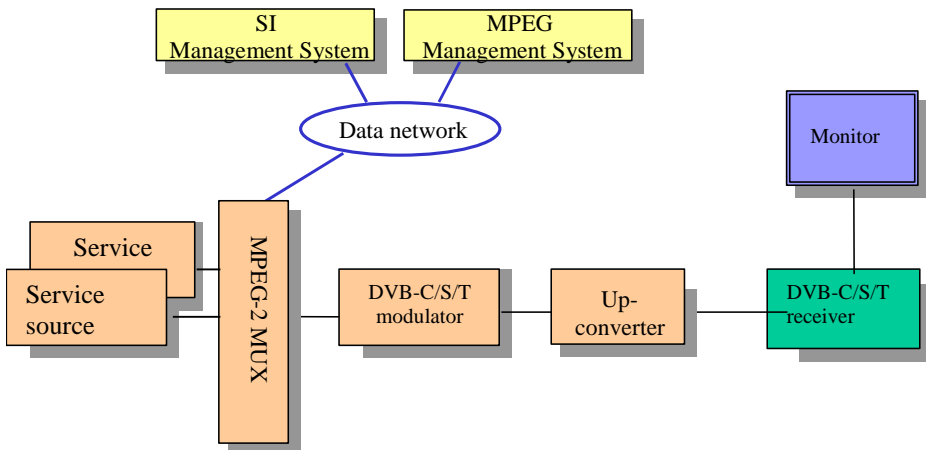

| | |
|---|--|
| | <p>The following applies for services that transmit in parallel more than one type of video/audio stream under the same service_id (e.g. simulcasting within the same service): For video decoding, NorDig IRDs shall select the service's video component, and set the default setting in accordance with the priority list in Table 12.26.</p> <p>For Audio decoding, NorDig IRDs shall prioritise the service's components according to chapter 6.5, Audio Prioritisation.</p> <p>NorDig IRDs shall ignore advanced audio streams when it does not support decoding those streams. For example, an IRD that do not include any AC-3 (downmix) decoder, (maybe only supports pass-through of AC-3 to the digital audio output), shall not choose the AC-3 audio stream as default. Instead it shall choose among the IRDs supported audio stream types according to chapter 6.5, Audio prioritisation.</p> <p>When several audio streams of the same type are received, the primary stream shall be selected in accordance with the definitions in section 6.5 (Audio Prioritisation).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the receiver NorDig IRD is able select video and audio components in priority order and handle dynamic changes in service (PMT and PIDs).</p> <p>Test procedure:</p> <p>This requirement is tested in Test Task 6 (video), Test Task 7 (Audio) and Test Task 8 (Subtitling).</p> <p>Equipment:</p> <div style="text-align: center;">  <pre> graph LR A[MPEG source] --> B[MUX 1] B --> C[Exciter] C --> D[DVB receiver] </pre> </div> <p>The idea in this test is that there is always video and audio available in the receiver output or iDTV's integrated display / speakers independently which input video and audio format(s) is(are) available in the service.</p> <p>Depending of the audio selection settings (stereo or multichannel) in receiver menu system receiver shall output always audio in the correct format in the physical audio output or iDTV's integrated speakers.</p> <p>MPEG source must have capability to simultaneously with</p> <p>* video component broadcast for following video formats:</p> <ul style="list-style-type: none"> • MPEG 2 MP@ML (SD) • MPEG 4 AVC HP@L4 (HD) • MPEG 4 AVC HP@L4 / L3 (SD) <p>* audio component broadcast for following audio formats:</p> <ul style="list-style-type: none"> • MPEG 1 Layer II • MPEG 4 HE AAC • AC 3 • E AC 3 |

| Test Case | Task 13:27 Dynamic update of PMT - Content_Protection_descriptor |
| Section | NorDig Unified 12.6.7 |
| Requirement | <p>This descriptor is used to signal the content protection level for the received service, see Table 12.29.</p> <p>The IRD shall use the signalled Content Protection level together with the IRD's HDCP user setting to determine if HDCP shall be enabled or disabled on the HDMI output interface, see section 8.6.4.</p> <p>The Content Protection descriptor shall be conveyed in the descriptor loop immediately following the program_info_length field in the Program Map Table. The descriptor only applies to the service to which the program map table is applicable. If the descriptor is missing for a service, it shall be interpreted as content protection level 0x01 (see Table 12.29).</p> |

2.14 Task 14: Navigator

2.14.1 General

These test tasks differ from the normal NorDig division of the test tasks. These test tasks are not listed in that order as the requirements appear in NorDig specification. Instead the order of the test tasks are divided in to a order how the different information data shall be able to be retrieved, handled and updated by the NorDig IRD. This division in this context is defined as following:

- ➔ Static PSI/SI data is defined as a data that must be updated by the IRD in the channel search or first time initialization.
- ➔ Quasi static PSI/SI data is defined as a data that must be updated by the IRD when it is toggled between stand-by mode and active mode or vice versa.

In order to maintain the reference to requirements, in every test task, the requirement from the specification is referenced.

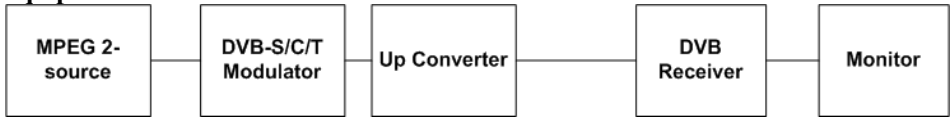

| | |
|---|--|
| Test Case | Task 14:1 Navigator: General |
| Section | NorDig Unified 13.1 and 16 |
| Requirement | <p>The NorDig IRD shall implement a basic Navigator, which provides user access to system information, and allows the user to control the operation of the IRD. The Navigator is by definition part of the system software.</p> <p>The Navigator shall include a service list function and a basic Event Schedule Guide (ESG), see ETSI EN 300 468. The Navigator shall also initiate bootloading, as described in chapter 10.</p> <p>The Navigator shall support the Nordic and English languages. (The Navigator is often referred to as the IRD's Menu system for handling DVB services including the service list(s) and ESG/EPG etc).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To test the existent of the Navigator functions.</p> <p>The ESG is tested in test tasks 13:17 to 13:23. Initiating of bootloading/system software update in Navigator is tested in test task 11.</p> <p>Equipment:</p> <div style="text-align: center;">  <pre> graph LR A[MPEG 2-source] --> B[DVB-S/C/T Modulator] B --> C[Up Converter] C --> D[DVB Receiver] D --> E[Monitor] </pre> </div> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Start the Navigator. 2. Check that it displays the valid services and allow control of the IRD. 3. Check that a service list is presented and that EIT p/f is displayed. 4. Verify navigator supports Nordic and English languages. 5. Verify that navigator has user setting for the preferences |

| | | | |
|-----------------------|--|-------------|--|
| | Expected result: The Navigator is present and complies with the requirement defined above. Verify initiating of bootloading /system software update is tested in Task 11Task 6.4. | | |
| Test result(s) | | | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|--|--|--|
| Test Case | Task 14:2 User Information about service components – Audio and Subtitling | | |
| Section | NorDig Unified 13.5.1 and 13.5.2 | | |
| Requirement | For services with multiple audio streams (PIDs), or in case of multiple NGA Preselections (1), the NorDig IRD shall be able to display information about available incoming audio streams / NGA Preselections (1), for the user to temporarily select one audio stream / NGA Preselection (1), The NorDig IRD shall be able to display information about different incoming subtitling pages within the selected subtitle stream/PID, for the user to be able to temporary select subtitling page or disable displaying subtitling. | | |
| IRD Profile(s) variants and capability | all IRDs | | |
| Test procedure | Purpose of test: To verify that IRD support selecting between available audio alternatives Test procedure: The actual test is carried out as part of Task 7. | | |

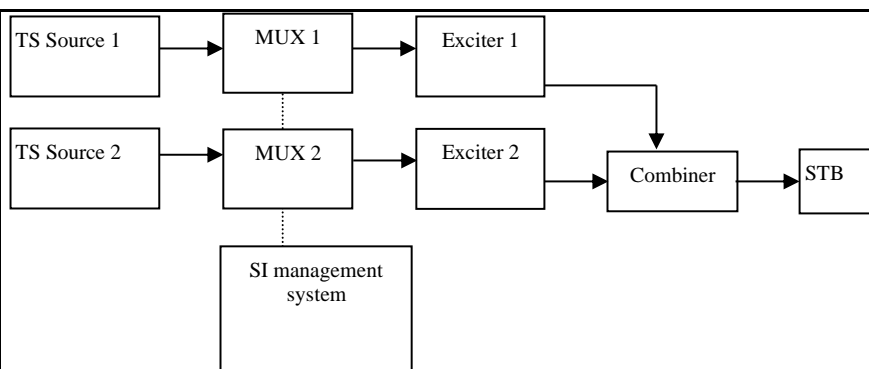

2.14.2 Static PSI/SI data

| | | | |
|--------------------|--|--|--|
| Test Case | Task 14:3 Service list - General requirement | | |
| Section | NorDig Unified 13.2.1 | | |
| Requirement | The service list shall be displayed to the user. The user shall be able to select a service from the displayed service list. The selected service shall appear immediately 13.2 Service List 13.2.1 Service List Requirements 13.2.1.1 Service List Requirements for IRDs, except for IP-based front-end The NorDig IRD shall maintain a service list based on SI-information. The NorDig IRD identifies a service uniquely through the combination of original_network_id, | | |

| | |
|--|---|
| | <p>transport_stream_id and service_id. (The broadcaster however shall make services uniquely identified in the broadcast through the combination of only original_network_id and service_id).</p> <p>The service list shall include the services and should also include the corresponding network names. The service list can be completely updated by the user by initiating the tuning/scanning procedure(s) for the connected tuners (see IRD specification). The corresponding part of the service list shall be updated within 1 second after reception of an updated SI table; updates should be made each time the NorDig IRD is switched from active to standby and shall be made each time the NorDig IRD is switched from standby to active.</p> <p>The IRD shall build up different sections inside one service list or build up several service lists, one for each different service category as the default IRD service list(s). Minimum three different sections/lists shall be supported for three different categories of service_types and they are 'TV', 'Radio' and 'Data'/'other' services, (see IRD specification for service categories).</p> <p>Whenever two or more services within same category are allocated to the same logical_channel_number, the NorDig HD IRD shall first prioritise the advanced codec services as stated (see IRD specification for priority between different services within same service category).</p> <p>The service list shall be displayed to the user. The user shall be able to select a service from the displayed service list. The selected service shall appear immediately (see section 11.4).</p> <p>The IRD should provide functionality for the viewer to build up additional personal service lists with the viewer's own preferred services (like mixed service_type) and own preferred order or manually re-order the default service list(s). If any network operator makes changes in his part of the service list, the NorDig should place new entries at the end of the corresponding part of the user service list.</p> <p>The information in the descriptors specified in IRD specification shall be displayed. The original network operator name may be omitted in case only one network is available.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To verify that the service list contains services and they are accessible (Dynamic parts of service list is tested in later Test Task in Task 14).</p> <p>.</p> <p>Equipment:</p>  <pre> graph LR A[MPEG 2-source] --> B[DVB-S/C/T Modulator] B --> C[Up Converter] C --> D[DVB Receiver] D --> E[Monitor] </pre> <p>Test procedure: Start the Navigator and go through and select all services in the list in a random pattern.</p> <p>Expected result: Verify that all services are accessible.</p> |
| Test result(s) | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments |
| Comments | <p>If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO</p> <p>Describe more specific faults and/or other information</p> |

| | |
|--|---|
| Test Case | Task 14:4 Service list – service types and categories |
| Section | NorDig Unified 12.1.4 and 12.1.5 and 13.2.1.1 |
| Requirement | <p>(12.1.4) The NorDig IRD shall minimum handle the service types listed in Table 12.1.</p> <p>Service types that are not supported by the NorDig IRD should be ignored. (If the (SDTV)(Basic) IRD do not support MPEG-4 AVC/MPEG-H HEVC video decoder, it should not list/install within the TV service list service types for advanced codec; 0x160x1F and 0x190x20).</p> <p>(12.1.5) The services are group into three service type categories; TV (1), Radio (2) and Others/data (3) services:</p> <p>(1) TV category includes services with service type; 0x01 digital (MPEG-2) TV service, 0x16 advanced codec SD TV service and, 0x19 advanced codec HD TV service, 0x1F HEVC/H.265 based HD/UHDTV service and 0x20 HEVC/H.265 based UHDTV HDR service.</p> <p>(2) Radio category includes services with service type; 0x02 digital radio sound service and 0x0A advanced codec digital radio sound service.</p> <p>(3) Others/(data) category includes all other service types that are not included in TV (1) and Radio (2) categories.</p> <p>The NorDig IRD (+) shall during installation of services create a common service list for each category (i.e. e.g. for a NorDig Basic IRD all 0x01, 0x16 and 0x19 within same TV category list and so on for the Radio and Other/data categories).</p> <p>The IRD shall build up different sections inside one service list or build up several service lists, one for each different service type as the default IRD service list(s).</p> <p>(13.2.1.1) The IRD shall build up different sections inside one service list or build up several service lists, one for each different service category as the default IRD service list(s). Minimum three different sections/lists shall be supported for three different categories of service types and they are 'TV', 'Radio' and 'Data'/'other' services,.</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>To test that the different type of services are located on different lists.</p> <p>Equipment:</p> |

| | Service1 | Service2 | Service3 | Service4 | Frequency |
|---|---|---|--|---|---|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 (MPEG2 TV service) Service type 0x01 S_name Test11 PMT PID 1100 V PID 1109 A PID 1108 LCD: 1 visible Encrypted | SID 1200 (Radio service) Service type 0x02 S_name Test12 PMT PID 1200 A PID 1208 LCD: 2 visible Clear | SID 1300 (Data service, e.g. stand-alone HbbTV service) Service type 0x0C S_name Test13 PMT PID 1300 V PID 1309 A PID 1308 (D PID 1307) LCD: 3 visible Clear (Only for HbbTV IRDs) | SID 1400 (HEVC SDR service) Service type 0x1F S_name Test14 PMT PID 1400 V PID 1409 A PID 1408 LCD: 4 visible Clear (Only for HEVC IRDs) | Can be chosen depending of the distribution media |
| MUX2 TS_id 2 Network_id 2 ²⁾ ON_id ¹⁾ | SID 2100 (AVC SDTV service) Service type 0x16 S_name Test21 PMT PID 2100 V PID 2109 A PID 2108 LCD: 4 visible Clear | SID 2200 (AVC HDTV service) Service type 0x19 S_name Test22 PMT PID 2200 V PID 2209 A PID 2208 LCD: 5 visible Clear | SID 2300 (Adv codec Radio service) Service type 0x0A S_name Test23 PMT PID 2300 A PID 2308 LCD: 6 visible Clear | SID 2400 (HEVC HDR service) Service type 0x20 S_name Test24 PMT PID 2400 V PID 2409 A PID 2408 LCD: 8 visible Clear (Only for HEVC IRDs) | Can be chosen depending of the distribution media |

¹⁾ ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes and it shall be same for both muxes

²⁾ Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

Channel list ID is set to 1 and country_code according to country settings in the receiver.

Services 1 to 2 in MUX1 are using MPEG-2 video and MPEG1 LII audio. Service 3 (visible data service) typically for stand-alone HbbTV service (i.e. not applicatble for SSU service case), for this test it can be enough to that the content is only video and audio or only HbbTV data or both (to simplify test setup). Service 4 is using HEVC SDR video.

Services 1 to 3 in MUX2 use MPEG-4 AVC and HE-AAC or E-AC-3 audio. Service 4 is using HEVC HDR video.

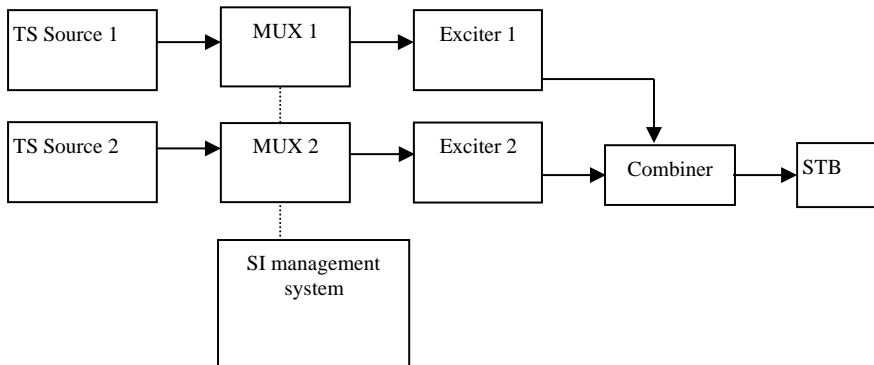

Test procedure:

1. Verify that the services on MUX1 and MUX2 have service types digital television services, digital radio service and data broadcast service according to table above.
2. Perform re-initialisation if needed.

| | <div>3. Check the service lists.</div> <div>4. Fill in the measurement record.</div> <div>Expected result: Different types of services are available on different category lists according to requirement. Categories are 'TV', 'Radio', and 'Data/Other' services. Optionally SDTV receiver doesn't store HDTV services.</div> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| | (13.2.1.1 extract) The NorDig IRD shall maintain a service list based on SI-information. The NorDig IRD identifies a service uniquely through the combination of original_network_id, transport_stream_id and service_id. The service list shall include the services and should also include the corresponding network names. The information in the descriptors specified in NorDig Unified table 13.1 and table 13.2 (see table 12.7 NIT descriptors above) shall be displayed. The original network operator name may be omitted in case only one network is available. (13.2.2 extract) The NorDig IRD shall make use of the descriptors listed in Table 13.1 in all NIT_actual (the transport stream the NorDig IRD is tuned to) and NIT_other (other transport stream) tables available in order to update the service list (system delivery data, number of transport streams, logic channel number etc). A Navigator shall never display services that the IRD is not able to receive or decode except for de-scrambling (i.e. a pure satellite IRD shall not display services which are described in NIT_other tables for secondary cable networks). Note: Table 13.1 descriptors Network_name_descriptor Satellite_delivery_system_descriptor S2_satellite_delivery_system_descriptor S2X_satellite_delivery_system_descriptor (for satellite IRD supporting DVB-S2X) Cable_delivery_system_descriptor Terrestrial_delivery_system_descriptor T2_delivery_system_descriptor Service_list_descriptor (Nordig) Logical_channel_descriptor | | | | | | | | | | | | | | | | | | | | | | | | |

|--|--|--|
| Test Case | Task 14:10 Service list – Inconsistent SDT_actual/NIT_actual and SDT_other/NIT_other | |
| Section | Nordig Unified 12.1.6 , NorDig Rules Of Operation 2.6.2 | |
| Requirement | NorDig logicalchannel descriptor and service_list_descriptor | |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs | |
| Test procedure | <p>Purpose of the test (addition to Task 14:06): To verify if the IRD updates service list quasi-static from SDT_actual instead of SDT_other and NIT_other actual service_list_descriptor.</p> <p>Equipment:</p>  <p>Test procedure:</p> <p>NIT_other and SDT_other information may under certain condition differ from NIT_acutal and SDT_acutal (for example in terrestrial network could be the case when IRD receive signals from several transmitting points and when these belongs to different content regions). Service_list in NIT is optional to broadcast. Therefore, it is important to verify how the receiver IRD extract-update and prioritise the information from the SDT_actual and NIT_actual service_list over the SDT_other and NIT_other in case the information is inconsistent.</p> <p>Transport stream MUX1 shall have at least one service configured and MUX2 shall have at least two services configured. MUX1 shall have a service that is signalled in LCD with logical channel number 1 ‘visible’ and MUX1 shall have a lower frequency than MUX2. MUX1/MUX2 shall have cross carried NIT and SDT information about MUX2/MUX1 (i.e. NIT_other and SDT_other describing MUX2/MUX1).</p> | |

| | |
|-----------------------|---|
| | <p>The MUX1 NIT_actual and SDT_actual shall be consistent with the content inside MUX1. The MUX2 SDT_actual and NIT_actual shall be consistent with the content inside MUX2. MUX1 SDT_other and NIT_other describing MUX2 from MUX1, here NIT_other service_list_descriptor and NorDig logical_channel_descriptor shall list only one of the two services in MUX2 and SDT_other shall only list only one of the two services in MUX2. I.e. the NIT/SDT_others in MUX1 pointing to MUX2 shall be inconsistent with NIT/SDT_actual in MUX2). The SDT_actual signals the service, but the service_list_descriptor in NIT_actual shall not have the service listed.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Make first time installation of the IRD, make sure that the IRD starts decoding/displaying a service from MUX1. 2. Verify the MUX1's NIT_other and SDT_other about MUX2 miss to list one of the services of MUX2 (inside service_list_descriptor, logical_channel_descriptor and service_descriptor) doesn't list at least one of the services carried within transport stream. With other words, there is an inconsistency between MUX1's SDT_other and NIT_other about MUX2 and MUX2's SDT_actual and NIT_actual 3. Zap to a service in MUX2. 4. Verify that all the carried services within transport streams are in the service list. <p>Expected result:</p> <p>Services, carried within transport stream (e.g. MUX2) and listed in SDT_actual, are listed in service list independently if the services are listed or not in SDT_other and NIT_other for the transport stream from other transport streams (e.g. MUX1) service_list_descriptor in NIT_actual.</p> |

|--------------------|--|
| Test Case | Task 14:11 Service list – Handling of multiple channel lists from same networks and NorDig LCD |
| Section | NorDig Unified 12.2.9.4 |
| Requirement | <p>(12.2.9.4) <i>Handling of multiple Channel lists from same network (LCD v2 only)</i></p> <p>The Logical Channel Descriptor version 2 enables transmission within same network of multiple Channel lists, meaning that there might it be several channel lists available for a IRD to choose between. The NorDig IRD may treat each channel list as complete with all intended services for that network (original network id) and it is up to the broadcaster to ensure that all intended services are included in all lists.</p> <p>The NorDig IRD shall at least store the sorting from one of the available Channel lists as default, but it is recommended that the NorDig IRD store all the transmitted Channel Lists sorting that matches the IRD's country code settings (especially for IRDs that are not letting the user choose list during installation).</p> <p>When several Channel Lists are available from same network (original network id) for the IRD during first time installation (or complete re-installation), the NorDig IRD shall choose the channel list as the default one with following priority:</p> |

| | <p>1.The list with same country code as the IRD's user preference setting's country code. If several list available with same matching country code, the IRD shall choose the one with lowest list_id value OR let the viewer choose from a list, (typically using the channel_list_name)</p> <p>2.If no Channel list has a country code that matches the user preference setting's country code, theNorDig IRD shall let the viewer choose from a list (recommended) OR choose the one with lowest list_id value.</p> | | | | | | | | | | | | | | | | | | |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes.

²⁾Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

For satellite networks the channel lists represented in tables below are valid due to the capability to receive services within one and same ON_id in different countries where even different country_settings in receiver are relevant. The LCN is equal in all different channel lists IDs.

For cable and terrestrial networks, a subset of channel lists is required as long as one and same ON_id is in concern. Transmissions in these networks are not normally dedicated for receivers with different country settings. Therefore, two channel list (e.g. ListDNKpri and ListDNKsec) with same country_code is enough to test requirement in this test.

The channel list under test shall not be signaled with channel_list_ID 1. E.g. if receiver dedicated to Swedish market is under test, ListSWEpri shall be signaled with other channel_list_ID than 1 in order to avoid malfunction in receiver where the receiver selects first list found.

MUX1:

| Channel_list_ID | Channel list name | Country_code |
|-----------------|-------------------|--------------|
| 1 | ListSWEpri | SWE |
| 2 | ListFINpri | FIN |
| 3 | ListNORpri | NOR |
| 4 | ListDNKpri | DNK |
| 5 | ListIRLpri | IRL |
| 6 | ListSWEsec | SWE |
| 7 | ListFINsec | FIN |
| 8 | ListNORsec | NOR |
| 9 | ListDNKsec | DNK |
| 10 | ListIRLsec | IRL |

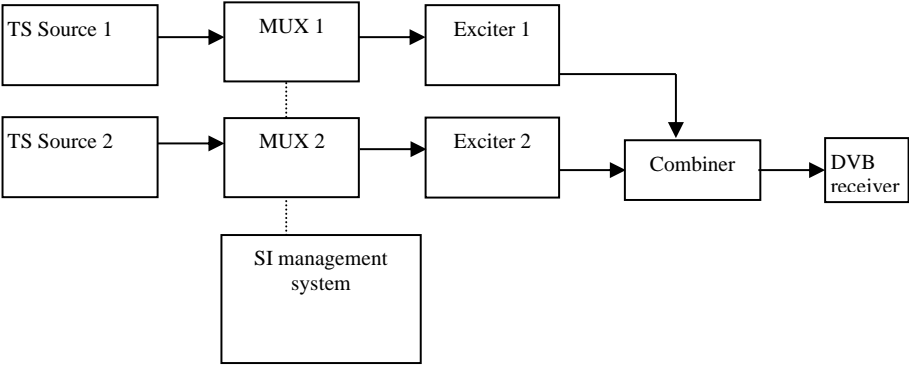

MUX2:

| Channel_list_ID | Channel list name | Country_code |
|-----------------|-------------------|--------------|
| 1 | ListSWEpri | SWE |
| 2 | ListFINpri | FIN |
| 3 | ListNORpri | NOR |
| 4 | ListDNKpri | DNK |
| 5 | ListIRLpri | IRL |
| 6 | ListSWEsec | SWE |
| 7 | ListFINsec | FIN |
| 8 | ListNORsec | NOR |
| 9 | ListDNKsec | DNK |
| 10 | ListIRLsec | IRL |

| Test Case | Task 14:13 Service list – Simultaneous reception of multiple networks and NorDig LCD |
| Section | NorDig Unified 12.2.9.5-12.2.9.8 |
| Requirement | <p>The NorDig IRD with terrestrial front-end shall be able to install several (DTT) original networks (with different original network ids).</p> <p>For multiple original networks (original network ids) the NorDig IRD shall first sort/list all services from one original network (original network id) according to that LCD, before sorting/listing the next original network. The first original network is the primary network and any additional received original networks are referred to as secondary network(s).</p> <p>The user shall be able to set which original network that shall be the primary, either via the user preferences, e.g. matching country setting (preferred) or via user selectable list of available original networks or similar mechanism. In order to simplify this, the NorDig IRD should map/translate the original network id into the country name. This means that for IRD where the user has set the country setting, the primary network should automatic be the country matching the original network id (and its services shall be listed first in the NorDig IRD's service list).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, DVB-T, DVB-T2 Terrestrial IRD |
| Test procedure | <p>Purpose of test: To verify the support for the reception of multiple networks and NorDig LCN.</p> <p>Equipment:</p> |

| | Service1 | Service2 | Service3 | Frequency |
|---|---|---|---|--|
| MUX1 TS_id 1 Network_id 1 ON_id X ¹⁾ | SID 1100 S_name Test11 S_type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN 2 visible | SID 1200 S_name Test12 S_type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN 5 visible | SID 1300 S_name Test13 S_type 0x01 PMT PID 1300 V PID 1309 A PID 1308 LCN 6 visible | Can be chosen depending of the distribution media |
| MUX2 TS_id 2 Network_id 2 ON_id Y ¹⁾ | SID 2100 S_name Test21 S_type 0x01 PMT PID 2100 V PID 2109 A PID 2108 LCN 2 visible | SID 2200 S_name Test22 S_type 0x01 PMT PID 2200 V PID 2209 A PID 2208 LCN 4 visible | SID 2300 S_name Test23 S_type 0x01 PMT PID 2300 V PID 2309 A PID 2308 LCN 7 visible | Can be chosen depending of the distribution media, but cannot be same as in MUX1 |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network). Values for X and Y shall be selected different.

Note for services belonging to secondary ON_id: SDT_actual service order shall not be equal with LCN number order because this may result to a situation that the receiver has sorted the services according to SDT_actual service order instead of the LCN number order.

Test procedure:

1. Perform factory reset to the receiver IRD
2. The primary network is either user selectable or automatically based on the country settings in the receiver IRD.
3. Perform channel search
4. Verify that the all services are found
5. Verify that the services are ordered firstly by the ON_id and secondly by the LCD.

Expected result:

User is able to select which network is the primary network, for example via the user sets the country setting, the primary network could (should) automatic be the country matching the original network id.

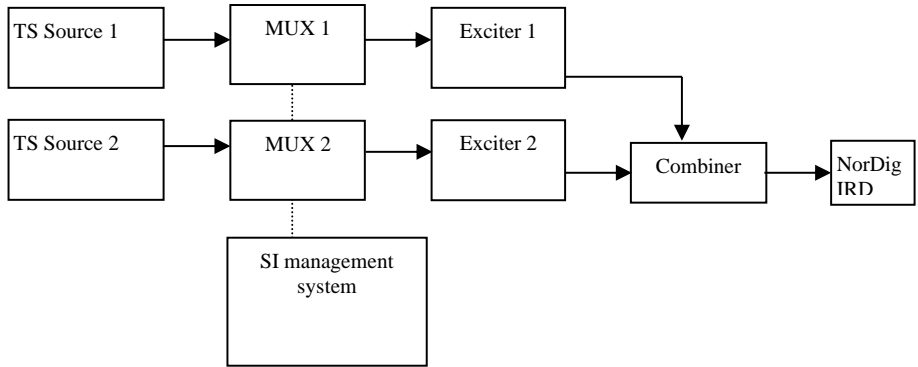

The channel numbers are correct.

Service in service list should be stored as listed below:

| Test Case | Task 14:14 Service list - Priority of LCN between SD and HDTV services |
| Section | NorDig Unified 12.1.4, 12.2.9.2, 12.2.9.3 12.2.9.6 and 13.2.1.1 |
| Requirement | <p>(12.1.4 Service Type)</p> <p>The NorDig IRD shall minimum handle the service types listed in Table 12.1. Service types that are not supported by the NorDig IRD should be ignored.</p> <p>(12.2.9.6) Conflict handling of Logical_channel_number</p> <p>If several services are allocated to the same logic_channel_number, (within the same channel list, as may be the case if several terrestrial regions can be received at the same location or several satellite networks are received), one service shall be ordered according to the logic_channel_number and the others shall be placed last in that list.</p> <p>Empty spaces in the broadcast logic channel numbering shall then not be used; instead they shall be located last, after the service with highest logic channel number of that service_type. (The broadcaster may quite consciously choose to leave empty spaces in the logic channel numbering, for future services, etc, in order to avoid a complete rearrangement of the list).</p> <p>Whenever two or more services within same category are allocated to the same logical_channel_number, the NorDig IRD shall set the priority of the services as stated in Table 12.1 above (see chapter 12.1.4 for priority between different services within same service category).</p> <p>Whenever two or more services within same category are allocated to the same logical_channel_number, the HD IRD shall priorities the advanced-codec services as following for TV category; first 0x20 HEVC, secondly 0x1F HEVC, thirdly 0x19 adv-codec HDTV service, fourthly 0x16 adv-codec SDTV service and last 0x01 (MPEG-2 SD) TV service and for radio category; first 0x0A adv-codec radio and secondly 0x02 radio service types.</p> <p>How to choose which service within same service type and same service priority that should be placed according to the channel list is up to the IRD manufacturer.</p> <p>(13.2.1.1) Whenever two or more services within same category are allocated to the same logical_channel_number, the NorDig IRD shall set the priority of the services as stated in Table 12.1 above (see chapter 12.1.4 for priority between different services within same service category).</p> |

|-----------------------|--|
| Test Case | Task 14:15 Service list – Component descriptor |
| Section | NorDig Unified 12.3.6 |
| Requirement | Zero or several Component descriptor(s) may be present in the SDT (according to DVB SI specification, ETSI EN300468 [13]), used in combination with the service_type in the Service descriptor to specify subtype of service, especially used for HEVC based TV services. It signals the decoding complexity of the components for the service and Services that are not supported by the NorDig IRD should not be visible in the service list. If no Component descriptor is included in SDT for a HEVC service, the NorDig HEVC IRD shall interpret a HEVC service with service_type 0x1F as an UHD SFR compatible SDR service and a HEVC service with service_type 0x20 as an UHD SFR compatible PQ10 HDR service. |
| IRD Profile(s) | HEVC IRDs |
| Test procedure | Purpose of test: |

To check the support for the Component descriptor.

Equipment:

| | Service1 | Service2 | Service3 | Service4 |
|---------------------------|---|---|---|--|
| MUX1 (1) | SID 1100 Service type 0x1F S_name Test11 LCD: 1 HEVC/H.265 Main Profile 1080p HD video, 50 Hz stream_content:0x9, stream_content_ext: 0x0, component_type:0x 00 | SID 1200 Service type 0x1F S_name Test12 LCD: 2 HEVC/H.265 Main 10 Profile 1080p HD video, 50 Hz stream_content:0x9, stream_content_ext: 0x0, component_type:0x 01 | SID 1300 Service type 0x1F S_name Test13 LCD: 3 HEVC/H.265 UHD 2160p video, 50Hz compatible stream_content:0x9, stream_content_ext: 0x0, component_type:0x 04 | SID 1400 Service type 0x20 S_name Test14 LCD: 4 HEVC/H.265 UHD 2160p video with PQ10 HDR stream_content:0x9, stream_content_ext: 0x0, component_type:0x 05 |
| MUX2 (1) | SID 2100 Service type 0x1F S_name Test21 LCD: 5 HLG10 HDR stream_content:0xB, stream_content_ext: 0xF, component_type:0x 04 | SID 2200 (2) Service type 0x1F S_name Test22 LCD: 6 HEVC temporal video subset for a frame rate of 100 Hz (dual PID backward compatible HFR) stream_content:0xB, stream_content_ext: 0xF, component_type:0x 05 | SID 2300 (2) Service type 0x20 S_name Test23 LCD: 7 HEVC temporal video subset for a frame rate of 100 Hz (dual PID backward compatible HFR) stream_content:0xB, stream_content_ext: 0xF, component_type:0x 05 | SID 2400 Service type 0x20 S_name Test24 LCD: 8 <i>No Component descriptor is included in SDT</i> |

(1) Frequency Can be chosen depending of the distribution media

(2) HFR HEVC temporal video subset for a frame rate of 100 Hz (dual PID backward compatible HFR), refers to one video PID with basic SFR 50Hz content and another video PID containing the extension from the basic SFR 50Hz PID up to 100Hz.

For the HFR dual PIDs (service Test22 and Test23), when only testing against NorDig HEVC IRDs (not supporting HFR) the second video PID (intended contain the extension 50Hz to 100Hz) the actual test encoding may be something else than the DVB/MPEG 50Hz-to-100Hz extensions as long as the signaling in PSI/SI (SDT and PMT) and first video PID (basic 50Hz SFR content) is according with DVB specifications. (This could be due to the complexity to generate real HFR dual PID encoding in the test setup).

Test procedure:

| | | | |

| Test Case | Task 14:16 Quasi-static update of service list – service added addition |
| Section | NorDig Unified 12.1.1 and 13.2.4 |

| | |
|--|---|
| Requirement | <p>The IRD shall at least start updating for any changes in the received “quasi-static” SI data, (NIT and SDT i.e. SI that is normally stored in the flash memory for service navigations such as service_name, service_ID, number of services), after it return to active from stand-by mode.</p> <p>(12.1.1) The NorDig IRD shall at least start updating for any changes in the received “quasi-static” SI data after it returns to active from standby mode. “Quasi static” SI-data includes NIT and SDT, i.e. SI that is typically stored in the flash memory for service navigations, such as service name, service_ID, number of services. (The ‘running status’ is not included in the quasi-static SI data. As a guideline for the implementation, this updating may be performed in the background, to shorten the start-up of the basic video and audio).</p> <p>... Initiation of update in the Service List that the IRD is not able to perform in the ‘background’ without disturbances or user action/confirmation, shall (only) be made after manual power up or after user selection to an affected service/transport stream (e.g. when re-scanning is needed).</p> <p>(13.2.4) The NorDig IRD shall dynamically update the Service List whenever changes occur in the NIT and SDT tables (i.e. typically handling the version numbers of the tables).</p> <p>Initiation of update in the Service List that the IRD is not able to perform in the ‘background’ without disturbances or user action/confirmation, shall (only) be made after manual power up or after user selection to an affected service/transport stream (e.g. when re-scanning is needed).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |

Test procedure

Purpose of the test:

To check that the IRD updates service list quasi-static when a service is added within transport stream.

Equipment:

NOTE: For the terrestrial networks where several transmitters can be received simultaneously, it is important to verify the parameters original_network_id, transport_stream_id and service_id to make a service unique. In cases where original_network_id and transport_stream_id are the same, but the services carried within transport stream differs, network_id can be interpreted to verify if the transport stream belongs to an other region.

Test procedure:

In initial phase transport stream carries at least one service. In second phase at least one new service is added inclusive the required PSI/SI signalization parameters.

1. Make first time installation of the IRD or verify that the IRD receiver doesn't have the service which will be added in the service list already installed in the service list.
2. Check that the original service is accessed.
3. Add a new service within transport stream, the added service(s) should be signalized as visible service in NIT NorDig Logical_channel_descriptor on a empty LCN (preferably one MPEG4/AVC and one HEVC based service should be added when testing HEVC IRDs)
 - a. Verify the service is added in SDT_actual, PAT and PMT.
 - b. Verify the service is added in service in NorDig Logical_channel_descriptor service_list_descriptor in NIT_actual
4. Verify that the IRD has added the new service(s) in service list and ESG,
5. if services not added then Toggle IRD receiver from active mode to standby mode and from standby mode to active mode. Verify the added service is added to service list.

Expected result:

IRD automatically adds and updates the new service in the service list
The service it is accessible.

| | |

(The ‘running status’ is not included in the quasi-static SI data. As a guideline for the implementation, this updating may be performed in the background, to shorten the start-up of the basic video and audio).</p> <p>(13.2.4) ...Initiation of update in the Service List for services signaled as invisible should not require action/confirmation from user, (see section 12.2.9 NorDig private; Logic_Channel_descriptor (LCD) for invisible services).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the IRD does not add a “non-visible” data service (Service type 0x0C, LCN: 0 non-visible, for example it could be an OTA SSU service for an IRD) in the service list quasi-statically when such a service is added within transport stream.</p> |

To verify that the IRD supports OTA SSU and can detect an added OTA SSU service which is signaled as a "non-visible" data service (this may be tested together with test tasks 11.1 to 11.3).

Equipment:

| | Service1 | Service2 | Frequency |
|---|---|--|--|
| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 S type 1 PMT PID 1100 V PID 1109 A PID 1108 Logic number LCN 1 visible | SID 1200 S_name Test21 S type 12 PMT PID 1200 V PID 1209 A PID 1208 Logic number LCN 0 non-visible | Can be chosen depending of the distribution media. |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network)

Test procedure:

In initial phase transport stream carries at least one service. In second phase at least one new "non-visible" data service is added inclusive the required PSI/SI signalization parameters.

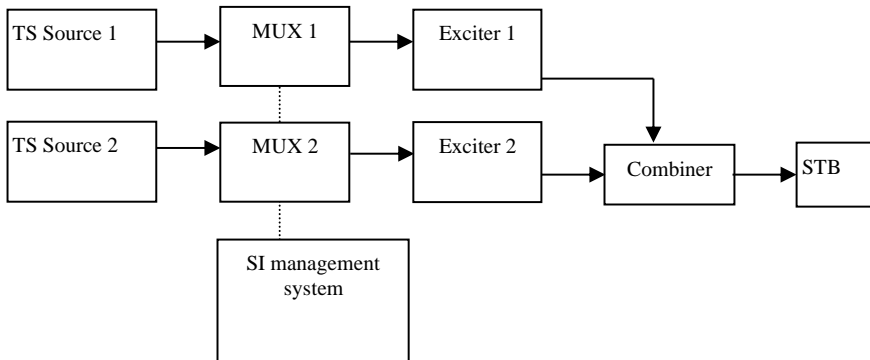

1. Verify that the **IRD receiver** doesn't have the service2 in MUX1 already installed.
2. Check that the service1 in MUX1 is accessed.
3. Add a new "non-visible" data service (Service2 in MUX1) within transport stream and that added service is listed in **NorDig Logical_channel_descriptor** as non-visible and with LCD 0.
 - a. Verify the service is added in SDT_actual, PAT and PMT.
 - b. Verify the service is added in logical_channel_number_descriptor in NIT_actual
4. Toggle the **IRD receiver** from active mode to standby mode and from standby mode to active mode
5. Verify that the IRD do not store nor list the "non-visible" service2 in service list nor ESG and that service2 do not disturb TV viewing.
6. For IRDs that support OTA SSU verify that the IRD detects the added service2 in MUX1² without disturbing end-user (and it doesn't store list the service2 in MUX1 in the service list), this may included in testing of task 11.1 to 11.3.

²⁾ For IRDs support OTA SSU, in case of the "non-visible" test service is a OTA SSU service AND is signaled to target the tested IRD, then the IRD can inform end-user with a notice e.g. that a new software is available (according with Test task 11.1 to 11.3). In case of the "non-visible" test service is a OTA SSU service but not targeted the tested IRD, the IRD shall not inform addition of the new OTA service. ~~Receiver can inform end-user with a notice e.g. in case of an own OTA service that a new software is available. In case of unmatched OTA service receiver shall not inform addition of a new service.~~

Expected result:

IRDs do not list "non-visible" services that is added.
IRDs that support OTA SSU detects the added "non-visible" OTA SSU data service quasi-statically without end-user disturbance (see also test task 11.1 to 11.3).

| | | | |

| MUX1 TS_id 1 Network_id 1 ON_id ¹⁾ | SID 1100 S_name Test11 S type 0x01 PMT PID 1100 V PID 1109 A PID 1108 LCN 1 visible | SID 1200 S_name Test12 S type 0x01 PMT PID 1200 V PID 1209 A PID 1208 LCN 3 visible | SID 1200 S_name Test13 S type 0x1F PMT PID 1300 V PID 1309 A PID 1308 LCN 5 visible | Can be chosen depending of the distribution media. |
| MUX2 TS_id 2 Network_id 2 ON_id ¹⁾ | SID 2100 S_name Test21 S type 0x19 PMT PID 2100 V PID 2109 A PID 2108 LCN 2 visible | SID 2200 S_name Test22 S type 0x16 PMT PID 2200 V PID 2209 A PID 2208 LCN 4 visible | SID 2300 S_name Test23 S type 0x20 PMT PID 2300 V PID 2309 A PID 2308 LCN 6 visible | Can be chosen depending of the distribution media. Not same as for Exciter 1 |

¹⁾ ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

²⁾ Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

Test procedure:

1. Verify that the private_data_specifier_descriptor and NorDig_logic_channel_descriptor are signaled in NIT_actual.
2. Perform a re-initialisation and a channel search.
3. Verify that the services from MUX 1 and MUX2 are located in service list as they are signaled.
4. Fill in the measurement record 1
5. Change following configurations:
 1. remove (MPEG2) service "Test11" from MUX1 and add this service to MUX2, rename it to "Test11 new"
 2. remove (MPEG4/AVC HD) service "Test21" from MUX2 and add this service to MUX1, rename it to "Test21 new"
 3. remove (HEVC) service "Test13" from MUX1 and add this service to MUX2, rename it to "Test13 new"
6. Toggle between active mode and standby mode.
7. Verify the services are stored at their logical numbers in the service list.
8. Fill in the measurement record 2.

When a move of service happens, its TS_id and Network_id change according to configuration in this test, the receiver shall identify the service as new and add it in the service list. When the receiver detects the service with equal LCN is removed, it shall move the service from the last positions in service list to its corresponding position signaled in LCN.

Expected result:

Services remain at their signaled logical channel positions after moving them between different transport streams.

Not same as for Exciter 1 |

¹⁾ ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

²⁾ Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

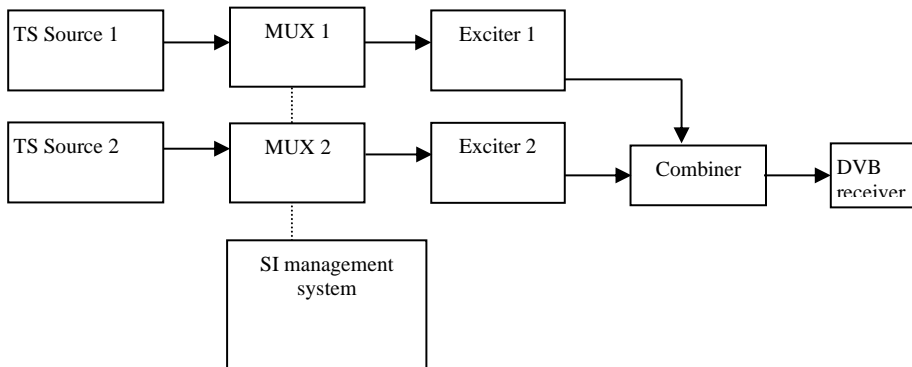

NOTE: For the terrestrial networks where several transmitters can be received simultaneously, it is important to verify the parameters original_network_id, transport_stream_id and service_id to make a service unique. In cases where original_network_id and transport_stream_id are the same, but the services carried within transport stream differs, network_id can be interpreted to verify if the transport stream belongs to an other region.

Test procedure:

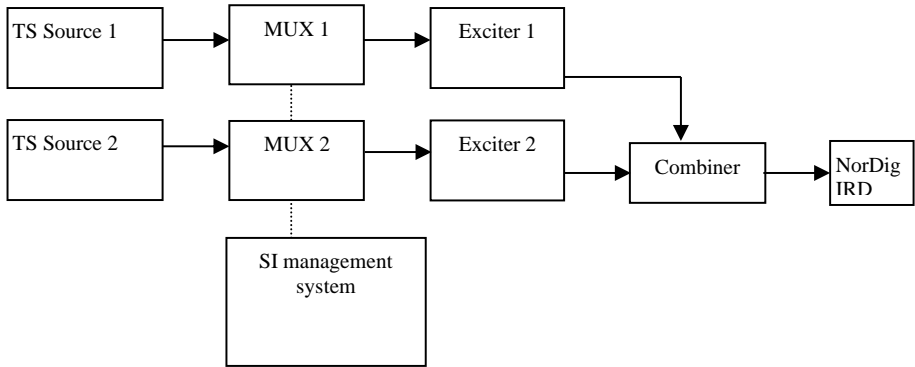

In initial phase transport stream carries at least two services. In second phase one service is removed inclusive the required PSI/SI signalization parameters.

1. Make first time installation of the IRD or verify that all signaled services within transport stream are in the service list.
2. Remove Service2 service Test12 carried within transport stream through MUX1 and service Test23 in MUX2 (for the case HEVC IRD is tested)
 - a. Verify the Service2 services Test12 and Test23 is removed from SDT_actual, PAT and PMT in MUXes.
 - b. Verify the services Test12 and Test23 Service2 is removed from service_list_descriptor in NIT_actual in MUXes.

| | |
|-----------------------|---|
| | <p>c. Verify the services Test12 and Test23 Service2 is removed from SDT_other in MUXes in case the SDT_other is signaled.</p> <p>3. Toggle IRD receiver from active mode to standby mode and from standby mode to active mode</p> <p>4. Verify the service(s) removed from the service list.</p> <p>Expected result: IRD automatically removes the service from the service list.</p> <p>NOTE 1: If the removed service is reserved for any reason, e.g. for timer use, the receiver-IRD will have a conflict in that time when the removed service is requested. It is receiver-IRD manufacturer's responsibility to handle such a conflict.</p> <p>NOTE 2: If the viewer is watching another service when a service is removed, displaying any notifications via OSD is not allowed to prevent disturbance to the viewer. In that time when the service is removed from the transport stream and user is watching an other service, displaying of any OSD is not allowed, due to the possibility that the viewer may be disturbed of that, e.g. in case of recording another service</p> <p>NOTE 3: If a user requests a removed service by zapping to that service, an OSD request to remove the service is allowed.</p> <p>NOTE 4: Note that bad signal / reception problems shall not trigger a service removal.</p> |

| Test Case | Task 14:22 Quasi-static update of NorDig LCN v1 |
| Section | NorDig Unified 12.2.9.1 12.2.9.2, 12.2.9.6 and 13.2.2 |
| Requirement | <p>NIT descriptors mandatory to receive and interpret if broadcasted:</p> <p>Private_data_specifier_descriptor (here used when private_data_specifier_value set to 0x00000029 to identify that a private descriptor within the descriptor loop with tag 0x83 is NorDig Channel Descriptor v1) NorDig channel descriptor v1</p> <p>Services that are not listed in NorDig Logic_channel_descriptor, shall be displayed in the service list(s) and shall be located last in the list (for that service_type).</p> <p>(12.1.1) The NorDig IRD shall at least start updating for any changes in the received “quasi-static” SI data after it returns to active from standby mode. “Quasi static” SI-data includes NIT and SDT, i.e. SI that is typically stored in the flash memory for service navigations, such as service name, service_ID, number of services..</p> <p>(12.2.9.6) <i>Sorting of services inside a Channel list</i> All “visible” services shall be displayed in the service list(s), sorted according to logic_channel_number and be addressed with a number in the service list equal to the logic_channel_number, as far as possible. The IRD may have several default service lists (or sections inside one) for the different service_types, for example one for each service_type or typically three main categories; TV, Radio and Others (“Others” is not applicable for IRDs without API). If the NorDig IRD has several service lists, the addressing of each service in each list shall match, as much as possible the logic_channel_number value (if no collision within a list). Services shall first be ordered depending on their original_network_id, secondly to their service category, thirdly to their logic_channel_number and last on their service_type (independently of several services have collision in the logic_channel_number or if they are listed or not in the logic_channel_descriptor). I.e. first all services from one original network and within that original_network first all TV category services, after that all Radio category services and last all Other category services. After that original network any next original network that the IRD is able to receive and so on. Services listed in the logic_channel_descriptor, shall have higher priority when ordering the services in the default service list, than services that are not listed. With other words, broadcast services may not be listed in any logic_channel_descriptor and these shall be displayed and accessible in the default service list, but be located last in the service list, in order to their service_type.</p> <p>(13.2.2) The NorDig IRD shall make use of the descriptors listed in Table 13.1 in all NIT_actual (the transport stream the NorDig IRD is tuned to) and NIT_other (other transport stream) tables available in order to update the service list (system delivery data, number of transport streams, logic channel number etc).</p> |
| IRD Profile(s) variants and capability | Basic, IRD, FE all IRDs |
| Test procedure | <p>Purpose of test: To check the support for the private data specifier and NorDig logic channel version 1 descriptors.</p> <p>To verify that the services, which are not listed in NorDig logic_channel_descriptor are displayed last in service list for that service type.</p> |

Not same as for Exciter 1 and 2 |

¹⁾ ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for all muxes

²⁾ Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

³⁾ Frequency can be chosen depending of the distribution media, however Mux1, Mux2 and Mux3 shall have different frequencies.

Test procedure:

1. Verify that the private_data_specifier_descriptor and NorDig_channel_descriptor are signaled in NIT_actual. No Simulcast replacement signaling for Test23 (with with that until step 6 below).
2. If needed perform a re-initialisation and a channel search.
3. Verify that the services from MUX 1, MUX2 and MUX3 are located in service list as they are signaled.
4. Fill in the measurement record 1
5. Verify for basic IRDs the service2/Test22 in MUX2 is listed last in the TV service list and for HEVC IRDs that the service1/Test11 in Mux11 is listed last.
6. Change the content of the following logical_channel_descriptors
 - a. service2/Test12 in MUX1: from 0 to 1 (visible)
 - b. service4/Test14 in MUX1: from 0 to 4 (visible)
 - c. service1/Test21 in MUX2: from 3 to 99 (remains visible)
 - d. service2/Test32 in MUX3: from 4 to 5 (remains visible)
 - e. service3/Test33 in MUX3: from 5 to 0 (non-visible)
 - f. service4/Test34 in MUX3: from 10 to 3 (remains visible)
 - g. service5/Test25 in MUX2: from 0 to 98 (visible)
 - h. service3/Test23 in MUX2: add Simulcast replacement descry pointing to service Test25.
7. Toggle between active mode and standby mode.
8. Verify the services are stored at their logical numbers in the service list.
9. Fill in the measurement record 2.
10. .

Expected result:

Services are stored in correct type of service lists and in their signaled logical channel positions.

Service2 in MUX2 is listed last in the TV service list.

Test result(s)

ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

²⁾Network_id for DVB-C and DVB-S/S2 IRD tests shall be same in all muxes

³⁾ Frequency can be chosen depending of the distribution media, however Mux1 and Mux2 shall have different frequencies.

For satellite networks the channel lists represented in tables below are valid due to the capability to receive services within one and same ON_id in different countries where even different country_settings in receiver are relevant. The LCN is equal in all different channel lists IDs.

For cable and terrestrial networks, a subset of channel lists is required as long as one and same ON_id is in concern. Transmissions in these networks are not normally dedicated for receivers with different country settings. Therefore, one channel list is enough to test requirement in this test.

2.15 Task 15: PVR Functionality

| | |
|---|---|
| Test Case | Task 15:1 Recording File System |
| Section | NorDig Unified 14.2 |
| Requirement | <p>The NorDig PVR shall at all times keep a file system of the PVR's recordings and make them available upon request for the user to select and playback.</p> <p>The user shall be able to list the recordings as:</p> <ul style="list-style-type: none"> all recordings, as ordered by date&time <p>For all recordings that have been programmed via the ESG or EPG, each recorded item in the NorDig PVR's list of recordings shall display for the user at least information about the recorded event's date of recording and event_name extracted from EIT data during the recording. If no event information is available for a specific recording then the service_name shall be used. For manual recording that span several events, it is recommended to use the service_name instead.</p> |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD |
| Test procedure | <p>Purpose of test: To verify that IRD recordings file system is according requirements</p> <p>Test procedure: This is a general requirement and will be tested in the following test tasks.</p> |

| | |
|---|--|
| Test Case | Task 15:2 Recording capacity |
| Section | NorDig Unified 14.2.2 |
| Requirement | <p>The NorDig PVR shall be able to indicate its momentary available recording capacity. The basis for the indication shall be explained in the instruction manual and should be in terms of capacity (e.g. GB), percentage or time (e.g. hours).</p> <p>The Manufacture shall clearly state the recording capacity for the NorDig PVR in marketing specification and in the instruction manual. It shall as a minimum be specified in terms of bytes (like GigaByte, GB etc).</p> |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD |
| Test procedure | <p>Purpose of test: To verify that IRD indicates the capacity of the mass storage.</p> <p>Equipment: IRD Under test</p> <p>Test procedure:</p> <ol style="list-style-type: none"> Verify that the recording capacity is presented in the IRD menu. Verify that the instruction manual states clearly the recording capacity. <p>Expected results: The IRD and the instruction manual indicates the recording capacity.</p> |

| | Task 15:13 ESG/EPG recording programming – individual event with CRID – same event recording | | |
| Section | NorDig Unified 14.3.2 | | |
| Requirement | If the user selects an event for recording from the ESG/EPG which has the same programme CRID value as an earlier recording within the NorDig PVR list of recordings, the NorDig PVR shall inform the user at the time of booking that this new selected event might already have been recorded and offer the option for the user to record anyway or not (1). The NorDig PVR should display information about this earlier recording (like the event name, date of recording and description). | | |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD | | |

| | |
|-----------------------|--|
| Test procedure | <p>Purpose of test: To verify that IRD informs user if ESG/EPG reording programming for individual event is already set for recording.</p> <p>Equipment: IRD Under test Stream with EIT including CRID. Two events shall have the same CRID value.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Open the EPG and schedule a recording by selecting an event with CRID in the EPG. 2. Try schedule another later recording from the ESG/EPG by selecting an event with the same CRID in the EPG that has been already selected for recording. 3. Verify that the IRD informs the user that the event is already set for recording. <p>Expected results: The IRD inform user if the same program with same CRID is already selected for recording from the EPG/ESG.</p> |

| | Task 15:14 ESG/EPG recording programming – series |
| Section | NorDig Unified 14.3.3 |
| Requirement | <p>All events that have the same series CRID belongs to the same Series. An individual event inside a Series is referenced here as an Episode. (For definition of CRID see section 12.4.6.2).</p> <p>The NorDig PVR shall be able to record a complete Series via the CRID. The NorDig PVR shall store and track series CRIDs that are programmed for recording for up to 91 days between occurrences in EIT schedule. To allow broadcasters to reuse a series CRID for a different editorial concept, the NorDig PVR shall discard any series CRIDs not seen in EIT for 91 days.</p> <p>The display of programmes selected for recording shall include an indication if the programme is included as a consequence of being one of a series.</p> <p>The IRD should be aware that the default authority may be changed over time (for example a service might have default authority added in SDT), the NorDig PVR should automatically update its stored default authorities (not only during installation).</p> <p>The NorDig PVR shall support recording of all episodes of a specific series via series CRID'ws in the broadcast. It shall be possible from ESG/EPG to program the NorDig PVR to record a series of events. The NorDig PVR shall indicate in the ESG/EPG that an event is part of a series (1). The NorDig PVR shall, if the user selects to record the event that belongs to a series, request the user what to record:</p> <ol style="list-style-type: none"> 1. Only the single event selected. 2. Several or All events (episodes) of the series |

|--------------------|--|
| | Task 15:15 Split recordings |
| Section | NorDig Unified 14.3.4 |
| Requirement | <p>A programme may consist of multiple EIT events within the same service or over several services. For example, a film might be divided into two parts/blocks interrupted by a news programme in the middle (see Figure 14.1 A) or a longer sport event might be split into several parts/blocks over several services, (see Figure 14.1 B).</p> <p>Signalling carried in the SI allows the PVR to identify and record all the events containing the parts of a single programme. A “split programme” is a single piece of content which comprises of two or more EIT events having the same CRID and IMI value with the gap from the scheduled end time (start_time plus duration) to the scheduled start time of any two of those events is less than 3 hours (see section 12.4.6).</p> |

| | | | |
|---|--|-------------|--|
| | <p>The NorDig PVR shall consider a split programme to be segments of a single item of content (1). When selecting a split programme for recording, the NorDig PVR shall select and record all constituent events so that the complete programme content is recorded.</p> <p>There are cases where a NorDig PVR may during the time of programming a recording only see a single event with the booked CRID and IMI combination (for example initially only the first part/block of the split programme has so far been included in the EIT).</p> <p>The NorDig PVR shall continue to monitor the EIT for additional events with the same CRID and IMI combination and include them to the selected recording (1). In case of overlap between the split events and if the NorDig PVR has limitation in recording capacity when back-to-back recording, then the NorDig PVR shall first finalise recording of the first part/event of the split programme (according to the events start time and duration) before starting recording the next part of the split programme, This is the same behaviour as back-to-back recordings.</p> | | |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD | | |
| Test procedure | <p>Purpose of test: To verify that IRD handles split recordings.</p> <p>Equipment:</p> <ul style="list-style-type: none"> • IRD Under test • Streams with split events of same content: <ul style="list-style-type: none"> ○ Stream 1: Event splitted on the same channel with max. 3 hour gap between splitted events ○ Stream 2: Event splitted between two channels in different multiplexes without gaps between splits ○ Stream 3: Event splitted between two channels in different multiplexes with gaps between splits (max. 3 hour) ○ Stream 4: Event splitted between two channels in different multiplexes with overlaps between splits <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Initiate recording of event part of a content split into several events from EPG. 2. The IRD presents information that there are several that are part of the same content and offer to record the whole content. 3. Repeat with all test streams <p>Expected result: The IRD is able to initiate recording of several events that are part of the same content and it is indicated in the EPG. The IRD presents this in a user friendly way.</p> | | |

| | Task 15:17 Recommended events |
| Section | NorDig Unified 14.3.5 |
| Requirement | <p>When the event selected has one or more recommendation(s) associated with it (signalised from original event with crid_type 0x03), the NorDig PVR should offer the option to record the recommendations (programme or series) as well as the selected programme or series.</p> <p>Once selected, the appropriate recommended event(s) shall also be marked as selected to be recorded on the EPG display.</p> <p>The recommended event(s) may also have recommendation(s) of its own. When user chooses to select to include the recommendation(s) into the recording, the NorDig PVR shall not include more than the original event's recommendation(s) (i.e. the NorDig PVR shall not follow more than the original event's initial recommendation and a recommendation should not be used to create a linked list of events to be recorded).</p> |

| | Task 15:18 Alternative Recording | | |
| Section | NorDig Unified 14.3.6 | | |
| Requirement | <p>When scheduled recordings overlap, the NorDig PVR shall use the alternate instance information (1), when provided, to record one or more of the programmes at their alternate times thereby minimising the conflict, subject to any device limitations (e.g. available space).</p> <p>Where a programme is repeated in its entirety a broadcaster may assign the same programme CRID to both EIT events. The NorDig PVR should detect an alternative instance of a programme (as when two events has same programme CRID) (1). This can be used to assist in resolution of booking clashes.</p> <p>Where alternate instances belong to the same series this allows the NorDig PVR to only record a single showing of each episode, usually the first.</p> | | |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD | | |
| Test procedure | <p>Purpose of test: To verify that IRD handles alternative instance recording.</p> <p>Equipment:</p> <ul style="list-style-type: none"> • IRD Under test • Stream 1: Recorded stream with split information about alternative instance of event on same channel. • Stream 2: Recorded stream with split information about alternative instance of event on same channel. <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Payout stream 1. | | |

| | |
|-----------------------|---|
| | <ol style="list-style-type: none"> Schedule an event conflicting with the event with alternative instance. The IRD shall notify that there is a collision but that there is an alternative instance that can be recorded on the same service instead. Playout stream 2. Schedule an event conflicting with the event with alternative instance. The IRD shall notify that there is a collision but that there is an alternative instance that can be recorded on another service instead. <p>Expected result: The IRD is able to use alternative information to record a programme at an alternative time in the case of conflict, including also on other TV services.</p> |

|---|--|
| | Task 15:19 Accurate Recording – EIT information present |
| Section | NorDig Unified 14.3.7 |
| Requirement | <p>The NorDig PVR shall determine the timing of the recording through monitoring of the EIT schedule and EIT present/following information.</p> <p>The NorDig PVR shall record at least for the duration where the event ID in the EIT present table matches the event ID of the event selected from the EIT schedule to a precision of 10 Seconds, unless there is a conflict with another recording event.</p> <p>Where the Event ID is signalled in EIT present table early (in advance of the schedule start_time) the NorDig PVR shall start recording. As a minimum the NorDig PVR shall handle early starts of at least 10 minutes, provided there are no other recordings in progress.</p> <p>The NorDig PVR shall monitor the EIT schedule and EIT present/following for updates to the start time and duration such that any event will be captured should the schedule be updated no later than 2 minutes prior to the current scheduled time of broadcast.</p> <p>Where the Event ID does not appear within EITp/f (in neither the present nor following tables) within the expected schedule time and duration the NorDig PVR should record according to the scheduled start time and duration. If the event id appears in the EIT following table at the scheduled start time, it means that the event is delayed and the NorDig PVR should wait with the start of the recording until the event ID appears in the EIT present table.</p> <p>The duration of the recording shall be changed even if the EITp/f is updated after the start time has elapsed, until the event is no longer present in the EIT present tab.</p> |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD |
| Test procedure | <p>Purpose of test: To verify that IRD handles accurate recording based on the EIT information according to the PVR_rec minimum scenario.</p> <p>Equipment: IRD Under test Stream with EIT information that is updated accurately (EIT present table), having consequent EIT schedule and EIT p/f scenarios as follows:</p> <ul style="list-style-type: none"> EIT1: Event start_time₁, duration = duration₁. |

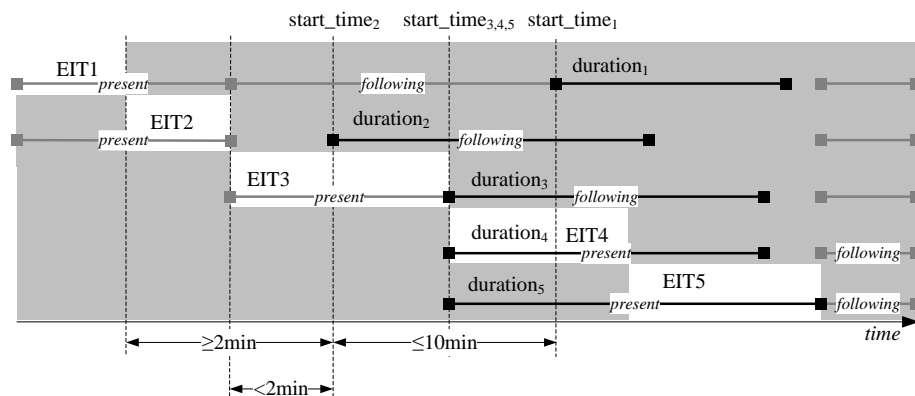

- EIT2: Event start_time₂ = start_time₁-10min and duration₂ ≠ duration₁.
- EIT3: Event start_time₃>start_time₂, duration₃ = duration₂.
- EIT4: Event start_time₄=start_time₃, duration₄=duration₃.
- EIT5: Event start_time₅=start_time₄, duration₅>duration₄.

Each scenario consists of multiple EIT sections:

- Event shall be included in the EIT_schedule of EIT1.
- Event shall be included in the EIT_following of EIT2 and EIT3.
- Event shall be included in the EIT_present of EIT4 and EIT5.
- Event start_time and duration shall be constant in EIT_schedule during the test.

Event event_id shall be constant during the test.

Event name or short_event_descriptor may be updated to indicate the originating EIT scenario number.

Test procedure:

1. Broadcast EIT schedule and EIT p/f scenario EIT1.
2. Schedule Event for recording from EPG/ESG.
3. Set IRD into the stand-by mode.
4. Update EIT scenario to EIT2, where Event start_time and duration are updated.
5. Shortly before start_time₂, update EIT scenario to EIT3, where start_time is delayed.
6. Update EIT scenario to EIT4 at start_time₃ so that Event is the present event.
7. While Event is present, update EIT scenario to EIT5, where duration is updated.
8. Fill in the measurement record.

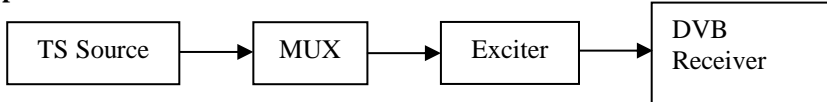

Expected results:

The IRD performs accurate recording based on the EIT present information.

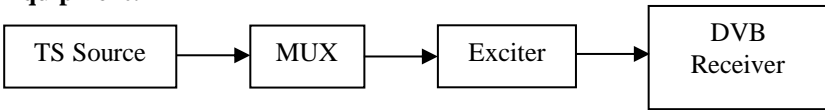

Recording should start at start_time₄ or alternatively recording shall start at start_time₂ ±10 s. Recording shall stop at start_time₅+duration₅±10 s.

| | | |
|-----------------------|---|----------------------|
| Test result(s) | Measurement record | |
| | Test point | Result OK/NOK |
| | IRD prioritizes EIT_present/following over EIT_schedule | |

| | Task 15:29 Back-to-back recordings – Changes in EIT information |
| Section | NorDig Unified 14.3.11, 14.3.16.2 |
| Requirement | <p>The NorDig PVR shall be able to record back-to-back events both on same and on different services.</p> <p>Back-to-back events refer to two events that immediately follow each other, i.e. the following event start_time is immediately after the previous events stop time,(start_time plus duration).</p> <p>For overlapping events see NorDig Unified 14.3.16.2. If the first event has same or higher priority as the second event (see 14.3.16.2) and the first event will overrun, if the NorDig PVR has limitation in recording capacity, it shall first finalise recording of the first event (including its overrun part) before starting recording the next event.</p> <p>The overrun shall be treated as the more important part of the events, see figure below. If the NorDig PVR has been set to add additional recording time (“safe margins”) before and after recorded events’ start and stop time, any overlapping “safe margins” between the back-to-back events shall be removed (if the NorDig PVR has limitation in recording capacity for this)</p> <p>If a conflict occurs in a partially or completely overlapping recording after the time of programming the NorDig PVR shall prioritize the recording with the highest priority , as illustrated in figures below. For conflict with events with same priority, the NorDig PVR shall first finalize the first recording (including any late over-run) before starting with next. (See also back-to-back recording).</p> |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD |

| | Task 15:37 Recording of parallel broadcast |
| Section | NorDig Unified 14.3.19 |
| Requirement | Some services and events are parallel broadcasted in multiple versions. In this context a parallel broadcast of same programme event is identified that all service's events have the same programme_CRID. Examples of parallel broadcasts are services with same national content but with different regional content and services with same content but with different resolution see.g. SD and HD simulcast broadcast services. The NorDig IRD that has been programmed to record an event with a specific programme_crid or series_crid which a programme_crid is part of, shall only record one instance of the event from one of the services when the event is parallel broadcasted over several services at the same time. |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD |

| | | | |
|-----------------------|--|-------------|--|
| Test procedure | Purpose of test: To verify that IRD handles recordings with parallel broadcasts. Equipment: IRD Under test Live stream or test network with EIT information. The network shall have simultaneous parallel broadcasts of events with equal programme_crid. Test procedure: 1. Schedule an event with multiple parallel broadcasts for recording. 2. Verify that IRD records only one of the event instances. Expected results: The IRD handles recordings with parallel broadcasts. | | |

| | Task 15:38 Playback - General | | |
| Section | NorDig Unified 14.4.1 | | |
| Requirement | The NorDig PVR shall be able to playback recordings of all supported service types (TV, radio etc) and all belonging components/PIDs (as described in 14.4.5). Only the service related interactive applications from the current viewed service (live or playback) are required to be active, this means that during playback all interactive applications from the live service in the background may be terminated. | | |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD | | |
| Test procedure | Purpose of test: To verify that IRD is able to play back the recordings it has performed with all belonging components/PIDs. Equipment: IRD Under test Live stream or test network. Test procedure: The requirement in this test will be verified in the following test tasks. Expected results: IRD is successfully able to play back the recordings. | | |

|-----------------------|---|
| Test Case | Task 15:45 Full service playback – Dynamic update of PMT subtitling language |
| Section | NorDig Unified 14.4.5 |
| Requirement | <p>During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event's parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p> |

¹⁾ON_id (Original_network_id) can be chosen in range 0x0001-0xfe00 (operational network) and it shall be same for both muxes

Services may contain other components, e.g. teletext, subtitling and multiple additional audio tracks.

PMT of the test services shall be updated during the test so that subtitling components are added and removed in various combinations, e.g. by the following pattern:

Test procedure:

1. Set the user preference for primary subtitling language to Lang1.
2. Set the user preference for secondary subtitling language to other than Lang1 or Lang2.
3. Start recording.
4. Select an another service.
5. Update the PMT table of the service and add/remove subtitling component(s).
6. Stop the recording.
7. Set the user preference for primary subtitling language to other than Lang1 or Lang2 and secondary subtitling language to Lang2.
8. Play back the recording.
9. Fill in the measurement record.

Expected results:

| | | | |
|----------------|--|------|---------------|
| | The receiver shall handle updates in PMT and record/playback according to the signaling. All decodable components in PMT have been recorded. User preference for primary/secondary subtitling language works correctly in playback. | | |
| Test result(s) | Measurement record: | | |
| | Test point | | Result OK/NOK |

|--------------------|--|
| Test Case | Task 15:49 Full service playback – Subtitling synchronization in time-shift |
| Section | NorDig Unified 14.4.5 |
| Requirement | During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section |

| | <p>14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event's parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p> | | | | | | | | | | |

|---|---|
| Test Case | Task 15:51 Full service playback – Dynamic update of video aspect ratio |
| Section | NorDig Unified 14.4.5 |
| Requirement | <p>During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event's parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p> |

|--------------------|--|
| Test Case | Task 15:52 Full service playback – Dynamic update of PMT CA status |
| Section | NorDig Unified 14.4.5 |
| Requirement | During playback of recorded content the user shall be able to perform the same full service selection as would have been possible during basic live viewing, such as select audio and/or subtitling language (if several components with same type are available), switch subtitling on or off, select audio format etc (with the limitation outlined in section 14.3.9). The basic live viewing refers to all streams excluding any HbbTV related streams. Dynamic changes in the services (such as a change of video aspect ratio or |

| | | | |
|---|---|-------------|--|
| | <p>change of audio format) that occur during the recording shall be processed in the same way as during live viewing.</p> <p>During playback the NorDig PVR shall be able to set the same control as during live viewing, for example blanking of video and muting of sound depending on the event's parental rating values (see 14.3.2) and signal protection (HDCP) on its digital output interface (see 9.9.4). For cases where the information is coming from EIT data (like parental rating descriptor), the playback shall at least act on the EIT signalling at the start of the recording (see 15.2.1). For the cases where the information is coming from PMT or the elementary streams (like signal protection and aspect ratio), the playback shall perform the same as live viewing and following any changes therein (i.e. PMT and elementary stream header information shall be stored and processed during playback).</p> | | |
| IRD Profile(s) variants and capability | Basic, PVR, IRD, all FE PVR IRD | | |

2.16 Task 16: IRD System Software and API

2.16.1 Introduction

This section specifies the test plans related to the NorDig HbbTV IRD and Nordig HEVC iDTV configurations. Nordig Basic TV IRD System software tests are defined elsewhere in this document..

Verified passing of the latest HbbTV official test suite [3] is a mandatory requirement for all NorDig HbbTV IRD profiles. The implementation of the HbbTV in the NorDig HbbTV IRD shall be verified by the manufacturer, i.e. the verification testing is based on self-testing by the manufacturer unless otherwise specified by the relevant network/Operator.

NorDig broadcast member may request to get a copy of the manufacture's HbbTV Verification Test report with test results, before approving a NorDig HbbTV Hybrid-IRD on the market.

Informative: The official HbbTV Test suite of the HbbTV Association (<http://hbbtv.org>) consists of a huge number of test cases, some of which the HbbTV Association has defined as mandatory and some as optional. The optional cases can be referred to as "additional test material". Some of these optional test cases have been contributed by NorDig and some by other testing regimes.

NorDig mandates that NorDig HbbTV Hybrid IRDs shall pass:

- all test cases that are included in the latest HbbTV test suite and which HbbTV organisation has defined as mandatory
 - If the NorDig IRD supports features that are defined as optional features in HbbTV, the corresponding HbbTV tests are mandatory (e.g. HbbTV AC-4 tests are mandatory on NorDig HbbTV HEVC IRDs.)
- a number of additional test cases that are included in the latest HbbTV standard test suite but which HbbTV Association has defined as optional/not mandatory (i.e. additional test material). These test cases are included in the list of Test Cases below. (Please Note that these test cases might be not optional mandatory in the standard HbbTV Test Suite and in other markets)
- a number of NorDig defined HbbTV test cases which are only included in this NorDig Test Plan.

NorDig mandates that Nordig HbbTV IRDs and HEVC iDTVs, i.e. devices supporting HbbTV standard version 2.0.1 or 2.0.2 (determined by the information included in the IRD's user agent as reported by the browser) shall pass

- all test cases in the official HbbTV DASH-DRM Reference application [<https://refapp.hbbtv.org/production>] relevant to the DRM schemes the IRD supports (Playready / Marlin / Clearkey) and/or the operator requires
 - Test cases include out-of-band subtitles, in-band subtitles, in-band events, advert insertion, multi-audio DASH and Live DASH.
- all test cases in the official HbbTV Test Suite related to out-of-band subtitles, in-band subtitles and advert insertion. Detailed test list is included in chapter 2.6.12

The current HbbTV Test Suite is available from HbbTV association and it provides a set of test material to test HbbTV device implementations. It is suitable for manufacturers of devices, including hardware and software components implementing the HbbTV specification. For information on how to obtain the HbbTV Test Suite, device manufacturer should refer to <http://hbbtv.org/resource-library/#testing-information-and-support>.

NorDig has contributed into HbbTV organisation with all our NorDig-developed test cases (including test material) and these are available from the HbbTV organisation's Test Repository as "additional test material". It is recommended to use this alternative. For any party who is unable to access the HbbTV Test Repository to obtain the Nordig HbbTV Test Materials, these can be obtained via the Nordig website (<http://www.nordig.org>) as well, free of charge, but subject to accepting the Nordig Test Suite Licence Agreement (available from the Nordig website). The approved Nordig HbbTV Test Suite is identical on both sources.

Running the test cases requires access to the HbbTV Minimum Test Harness, a commercial harness, or the Nordig Helper App. The latter is a tool for running the tests and obtaining the results in a meaningful way. Note that the Nordig Helper App enables only the tests designated with «org.nordig» domain to be run.

Please note that currently the Minimum Test Harness is able to run only the tests that are approved to the official HbbTV Test Suite. CI+ test cases are also mandatory to pass as they are approved to the official HbbTV Test Suite. To run the CI+ tests, a test CAM which is compatible with the test harness will be needed. This is likely to either be available through the provider of your commercial test harness, or in the case of the Minimum Test Harness from Eurofins Digital Testing. Please contact DigitalTestingSupport@eurofins.com for assistance in running the CI+ tests in the Minimum Test Harness. The Nordig HbbTV Test Suite includes the materials for tasks 16:1 to 16:59.

National testing regimes, operators and broadcasters define the final requirements for any regional certification process, and these might include additional test suites and test cases (for example DRM tests). Additional test materials are available from the latest release of the HbbTV Test Suite or from the entity organizing the testing regime. The chapter and table 2.16.2. define the test tasks that are by default mandatory to pass the Nordig Test Suite part of any national regime.

Development of the Nordig Test cases is a continuous process and can be tracked in HbbTV Redmine system under the «Nordig API» -group. Redmine system can be reached from <https://hbbtv.org/redmine/projects/nordig-api-group>.

Detailed test task procedures are not repeated here – they can be accessed by referring to the xml test description files and they are visible in the RUT and PC computer screen running the test harness while executing the tests.

2.16.2 List of test cases

All NorDig HbbTV Hybrid IRDs shall in addition to the HbbTV's mandatory test cases also pass following listed test cases defined within the HbbTV test suite and in the current chapter below:

| NorDig Test Task |
|--|
| Test Task |
| 2.16 Task 16: IRD System software and API |
| Task 16:1 org.nordig_00000010 Current time, TDT/TOT available, NTP available |
| Task 16:2 org.nordig_00000020 Current time, no TDT/TOT tables, NTP available |
| Task 16:3 org.nordig_00000030 Current time, no TDT/TOT tables, no NTP, but SNTP is available |
| Task 16:4 org.nordig_00000100 parental control, blocking application |
| Task 16:5 org.nordig_00000300 EBU teletext, no HbbTV teletext |
| Task 16:6 org.nordig_00000310 HbbTV teletext, no EBU teletext |
| Task 16:7 org.nordig_00000320 EBU teletext and HbbTV teletext |
| Task 16:8 org.nordig_00000330 EBU Teletext, HbbTV teletext signalled but not available |
| Task 16:9 org.nordig_00000340 No EBU Teletext, no HbbTV teletext |
| Task 16:10 org.nordig_00000350 No EBU teletext, HbbTV teletext signalled but not available |
| Task 16:11 org.nordig_00000400 EBU subtitles over broadband TS, A/V object, no scaling |
| Task 16:12 org.nordig_00000410 EBU subtitles over broadband TS, A/V object scaled down |
| Task 16:13 org.nordig_00000420 EBU subtitles over broadband TS, A/V object scaled up |
| Task 16:14 org.nordig_00000430 DSM-CC stream events and DVB subtitles |
| Task 16:15 org.nordig_00000440 DSM-CC stream events and EBU subtitles |
| Task 16:16 org.nordig_00000500 Broadcast video scaling, 1 x 1 |
| Task 16:17 org.nordig_00000510 Broadband TS video scaling, 1 x 1 |
| Task 16:18 org.nordig_00000520 Broadband MP4 video scaling, 1 x 1 |
| Task 16:19 org.nordig_00000600 EIT P/F, characters |
| Task 16:20 org.nordig_00000610 EIT MetadataSearch, characters |
| Task 16:21 org.nordig_00001010 Exit button on broadcast independent application: restore broadcast video |
| Task 16:22 org.nordig_00001020 Exit button: restore broadcast video from PIP mode |

| NorDig Test Task | |
|------------------|---|
| Test Task | |
| Task 16:23 | org.nordig_00001050 Setting of preferredUILanguage |
| Task 16:24 | org.nordig_00001060 Updating preferredUILanguage after language change in Navigator |
| Task 16:25 | org.nordig_00001070 Switch subtitles: DVB to EBU teletext |
| Task 16:26 | org.nordig_00001080 Switch subtitles: EBU teletext to DVB |

2.16.3 Test cases

| | |
|---|--|
| Test Case | Task 16:1 – 16:50 |
| Section | Multiple (see test case descriptions) |
| Requirement | Multiple (see test case descriptions) |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD |
| Test procedure | <p>Purpose of test: See the test case description from the Test Harness / Helper app UI</p> <p>Equipment: HbbTV Test Harness or NorDig Test Suite helper app</p> <p>Test procedure: Run the test using the Test Harness or helper app. Follow the on-screen instructions.</p> <p>Expected result: PASS</p> |
| Test result(s) | Test Harness returns PASS [OK] or FAIL [Fault], mark the result below. |
| Conformity | <input type="checkbox"/> OK [PASS] <input type="checkbox"/> Fault [NOT OK] |
| Comments | <p>If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO</p> <p>Describe more specific faults and/or other information</p> |
| Date | Sign |

| | |
|------------------|--|
| Test Case | Task 16:51 HbbTV Global setting |
| Section | Nordig Unified 15.2 |

| | | | |
|---|---|-------------|--|
| Requirement | The NorDig HbbTV Hybrid IRD shall have HbbTV feature as enabled by default (see Section 16.3). It shall have a menu option to allow user to enable / disable the HbbTV feature as a whole and it should have a menu option to allow user to enable / disable the HbbTV feature service by service. | | |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD | | |
| Test procedure | <p>Purpose of test: Verify that the IRD has an option to turn HbbTV on and off globally.</p> <p>Equipment: IRD under test. Stream with a HbbTV application signalled.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Turn HbbTV setting OFF 2. Check that HbbTV application is not launched. 3. Turn HbbTV setting ON 4. Check that HbbTV application is launched. <p>Expected result: PASS</p> | | |
| Test result(s) | [OK] or FAIL [Fault], mark the result below. | | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|--|--|--|
| Test Case | Task 16:52 – 16:59 (es.TDThibrida and fr.HDForum tests) | | |
| Section | Multiple (see test case descriptions) | | |
| Requirement | Multiple (see test case descriptions) | | |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD | | |
| Test procedure | <p>Purpose of test: See the test case description from the Test Harness.</p> <p>Equipment: HbbTV Test Harness.</p> <p>Test procedure: Run the test using the Test Harness. Follow the on-screen instructions.</p> <p>Expected result: PASS</p> | | |
| Test result(s) | Test Harness returns PASS [OK] or FAIL [Fault], mark the result below. | | |
| Conformity | <input type="checkbox"/> OK [PASS] <input type="checkbox"/> Fault [NOT OK] | | |

| | | | |
|--|---|------|--|
| Date | | Sign | |
| Test Case | Task 16:60 Teletext - Simultaneous EBU Teletext and HbbTV Digital Teletext (8:6) | | |
| Section | NorDig Unified 7.1.67 | | |
| Requirement | <p>For services that have both an EBU Teletext service and an HbbTV Digital Teletext application signaled and available, the NorDig HbbTV shall (4) be able to start and display the HbbTV Digital Teletext application as well as being able to start and display the EBU Teletext service (one at a time).</p> <p>The NorDig HbbTV shall (4) start teletext and be able to toggle between any HbbTV Digital Teletext and any EBU Teletext service as described in clause 5.3.4 (“Starting digital teletext applications”) of HbbTV specification ETSI TS 102 796.</p> | | |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD | | |
| Test procedure | <p>Purpose of test:</p> <p>To verify that the IRD is able to start EBU Teletext and HbbTV Digital Teletext (one at the time).</p> <p>A transport stream containing a test services with EBU Teletext and HbbTV Digital Teletext application is required.</p> <p>Test procedure:</p> <ol style="list-style-type: none"> 1. Tune to a serve that contains both EBU Teletext and HbbTV Digital Teletext application. 2. Verify that the user can toggle between EBU Teletext and HbbTV Digital Teletext application by pressing the “text” button in the RCU. <p>Expected result:</p> <p>User can toggle between EBU Teletext and HbbTV Digital Teletext application.</p> | | |
| Test result(s) | [OK] or FAIL [Fault], mark the result below. | | |
| Conformity | <input type="checkbox"/> OK <input type="checkbox"/> Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | <p>If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO</p> <p>Describe more specific faults and/or other information</p> | | |
| Date | | Sign | |

| | | | |
|--|--|--|--|
| Test Case | Task 16:61 Subtitling - coexistent with HbbTV applications (8:7) | | |
| Section | NorDig Unified 7.1.78 | | |
| Requirement | <p>A NorDig HbbTV Hybrid shall support simultaneous display of HbbTV application and subtitles (DVB subtitling and EBU teletext subtitling), both for broadcast and at least for MPEG2 TS delivered via broadband [29].</p> <p>The NorDig HbbTV Hybrid shall display the HbbTV application over the subtitles as described in clause 10.1.4 (“Display model”) of HbbTV specification ETSI TS 102 796 [30]. This means that if the video is up or down-converted, to other than full screen video, the subtitles shall either be rescaled/repositioned appropriately or not displayed at all.</p> | | |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD | | |

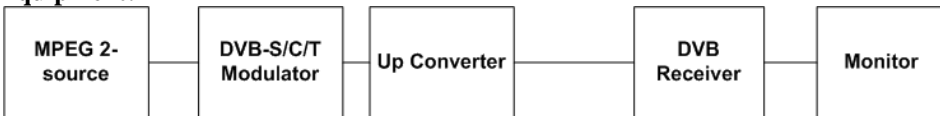

| | | | |
|-----------------------|--|-------------|--|
| Test procedure | Purpose of test: To verify that DVB and EBU teletext subtitling can coexist with HbbTV applications. A transport stream containing a test service with DVB and EBU teletext composition subtitling component and at least one signaled service bound HbbTV application at the same channel. Test procedure: 1. set the IRD to the autostart mode for the HbbTV services and ensure that subtitles are enabled 2. search channels 3. zap to a channel that contains the HbbTV service and subtitles 4. verify that when the HbbTV application is not using the same graphics plane or area of the plane as the subtitles, the subtitles are visible Expected result: The subtitles are visible with a HbbTV application, when they are not sharing the same area of the graphics plane. | | |
| Test result(s) | [OK] or FAIL [Fault], mark the result below. | | |
| Conformity | <input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |
| Date | | Sign | |

| | | | |
|---|---|-------------|--|
| Test Case | Task 16:62 Remote Control Key event mapping for NorDig HbbTV (9:11) | | |
| Section | NorDig 8.7.2.610 | | |
| Requirement | The NorDig HbbTV Hybrid IRD shall generate (HbbTV) events according to Table 8.37 when a key is pressed on the NorDig IRD remote control. | | |
| IRD Profile(s) variants and capability | Hybrid HbbTV IRD | | |
| Test procedure | Test procedure: Check the manufacturer technical specification / compliance list or verify the remote control functions. Expected result: The minimum hardware requirement is fulfilled. | | |
| Test result(s) | [OK] or FAIL [Fault], mark the result below. | | |
| Conformity | <input type="checkbox"/> OK Fault <input type="checkbox"/> Major <input type="checkbox"/> Minor, define fail reason in comments | | |
| Comments | If possible describe if fault can be fixed with software update: <input type="checkbox"/> YES <input type="checkbox"/> NO Describe more specific faults and/or other information | | |

2.17 Task 17: User Preferences

| | |
|---|--|
| Test Case | Task 17:1 <u>Stored preferences</u> |
| Section | NorDig Unified 16.1 and 16.2 |
| Requirement | The user shall be able to store preference settings in persistent memory. All user preference settings listed below shall remain when changing service and when re-starting the IRD. The following user preferences shall be implemented in the NorDig IRD, unless it is stated below as optional (should) requirement. (See section 16.4 for factory default values). |
| IRD Profile(s) variants and capability | <u>Basic, IRD, FE all IRDs</u> |
| Test procedure | <p>Purpose of test: To verify stored user preferences</p> <p>Equipment:</p>  <pre> graph LR A[MPEG 2-source] --> B[DVB-S/C/T Modulator] B --> C[Up Converter] C --> D[DVB Receiver] D --> E[Monitor] </pre> <p>Test procedure:</p> <ol style="list-style-type: none"> Verify following user preferences: <ul style="list-style-type: none"> General: Service list. General: Country setting. General: Talking menus/Text-to-Speech, if this optional feature is supported. General: SSU setting(s). General: HbbTV setting(s) for NorDig HbbTV IRD. General: HDCP preferences (optional): <i>(ON, OFF, AUTO)</i> Video (STB): HDMI Video preferences for Output video format <i>(auto or fixed)</i> Audio: Primary and secondary audio language Audio: Audio format for the digital outputs <i>(stereo or multichannel)</i>. Audio: Audio Type <ul style="list-style-type: none"> <i>(For IRDs minimum between: Normal or Supplementary, optional between Normal, AD, SS or all supplementary.</i> <i>For NGA IRDs: Normal, AD, SS or all supplementary)</i> Audio (STB): Audio delay value for the digital audio output Audio: Audio output method for HDMI and S/PDIF output <i>(pass-through, decoded to PCM, transcoded to DTS or AC-3)</i>. Audio: Audio Mixing level for receiver mixed supplementary audio Audio (NGA capable HEVC IRD): Dialogue Enhancement <i>(on or off)</i> Audio (NGA capable HEVC IRD): Dialogue Enhancement enhancement level (optional) Subtitling: Primary and secondary subtitling language <p> * Service list * Country settings * Talking menus/Text to speech * SSU settings * HbbTV settings * HDCP preferences (Optional) * Video display preferences * Audio preferences * Primary and secondary audio language preferences </p> |

| | |
|-----------------------|--|
| | <ul style="list-style-type: none"> * Primary and secondary subtitling language preferences * Service list preferences * Country settings preferences * Audio transcoding preferences * HDMI preferences * Supplementary Audio settings |
| | Expected result: User preferences are as defined. |

| | HDMI Video output | Automatic using E-EDID information | |

| | | | |
|---|---|--|--|
| | HDCP | ON or as specified by the relevant network/ CA operator see section 8.6.4 (5) | |
| | SSU | If this menu item is supported, a value that disables Fully Automatic mode (6) | |
| | PVR recording priority, SD vs HD | HD | |
| | Talking menus (Text-to-Speech), optional | Off | |
| <p>Note 1: In the first time installation and resetting to factory default settings, the DC power supply shall be switched off. It is recommended that the receiver ask if the DC power supply is turned on in the first time installation and in the installation after resetting to factory settings, to speed up the initialisation procedure.</p> <p>Note 2: Applicable for IRDs with RF PAL modulator</p> <p>Note 3: Mode 'Normal' refers to Audio type 0x00 'Undefined' For the case of an IRD implementing audio type with two separate settings (Audio Description plus Spoken Subtitling), this mode 'Normal' refers to that Audio Description off and Spoken Subtitling off.</p> <p>Note 4: Supplementary Audio (SA) refers here to both Audio Description (AD) and Spoken Subtitling and (SS).</p> <p>Note 5: The IRD should provide an option to manually set the HDCP default to "ON" or "OFF", see section 8.6.4.</p> <p>Note 6: Settings for SSU (System Software Update) may be implemented as one combined setting or several settings for different parts. The settings required will depend on the combination of modes supported (see 10.2) but could, for example, take the form of "Enable/Disable" or "Fully Automatic / Semi Automatic".</p> | | | |
